ABSTRACT

The Kids Count Data Book examines trends in the well-being of Kansas children. This statistical portrait is based on trends in 22 indicators of child well-being, grouped into 5 areas: (1) economic well-being--births to single teens, child poverty rates, free school meals, and family economic assistance; (2) physical health and safety--childhood deaths, infant mortality, early prenatal care, immunization rates, and low birth-weight infants; (3) childhood care and education--Head Start participation, child care availability, high school graduates pursuing post-secondary education and training, births to mothers with less than a high school degree, and high school graduation rates; (4) emotional well-being--out-of-home placement, teen violent deaths, and reported and substantiated child abuse and neglect; and (5) social behavior and social control--juvenile court filings, youth alcohol use and binge drinking, and youth who have ever used drugs other than alcohol. Following an executive summary, Section 1 of the report discusses welfare reform in Kansas and makes recommendations for strengthening the safety net for families no longer receiving welfare services. Section 2 consists of tables detailing findings for each indicator by county and statewide. Section 3, the bulk of the report, presents statistics for each county, a graphic and narrative description of trends, and demographic information. Among the findings, the data book shows significant improvement in immunization rates, infant mortality, childhood death, teen violent death rates, youth drug use, and Head Start participation. Concerns were evident in reports and substantiations of child abuse or neglect, juvenile court filings, childhood

poverty rates, and low birth-weight infants. Information on data sources is appended. (KB)

Our Work

Kansas Action for Children is a private, not-for-profit, citizen-based corporation founded in 1979. We work on behalf of all children to ensure that their physical and emotional needs are met and that they become healthy and contributing adults.

- We *paint the picture* of Kansas children by gathering and publicizing information on child well-being through the *Kansas Children's Report Card*, the *KANSAS KIDS COUNT DATA BOOK*, and special reports.
- We *advance alternatives* by developing state policy that is family and child friendly. Over the years, programs related to early childhood development, teen pregnancy, preventive health care, citizens review boards, and services to children in troubled families have stemmed from our work.
- We *build the base* of citizen advocacy for children by working with citizens and organizations across the state. We believe that hundreds of citizens speaking out for children can help create communities that support families and children.

EXECUTIVE SUMMARY

The 1999 KANSAS KIDS COUNT Data Book provides state and county data on 22 indicators of the well-being of children and families in Kansas. These indicators reflect five different areas of functioning: economic well-being, physical health and safety, childhood care and education, emotional well-being, and social behavior and control. By highlighting state and county trends, we hope to raise public awareness about the plight of vulnerable children and encourage citizen action.

As with last year's data book, the 1999 KANSAS KIDS COUNT Data Book shows improvement in some indicators but others continuing to worsen:

Measures Showing Significant Improvement

- The percent of kindergartners fully immunized by age two improved dramatically in 1997. Compared to the previous five-year period, Kansas celebrated a 23-percent improvement in 1997. All but two counties (Lincoln and Stanton) showed an increase. The remarkable improvement in the percentage of Kansas' kindergartners who were fully immunized by the age of two places the state closer to achieving the country's Healthy People 2000 objective of 90-percent immunization of all two-year-olds.
- Declining infant mortality, childhood death and teen violent death rates were also indicative of improvements in physical health and safety for Kansas' kids.

- Among children in grades six, eight, ten, and 12 who participated in the survey, 11 percent reported at least one use of drugs in their lifetime. This figure is a substantial reduction from the 17-percent base rate and is certainly very positive news. However, we caution that shifts in patterns of survey participation may account for some changes in reported use.

- Head Start was available for more eligible children in Kansas in 1998 than at any time over the past ten years. The Head Start combination of direct intensive services to children and referrals to supplemental services reflect the best research and evaluation of how to achieve effective and long-term results for children and their families.

Measures Remaining Steady

- All measures of educational achievement remained relatively steady.
- The percent of mothers receiving early prenatal care continued to hover around 85 percent.
- Out-of-home placement rates remained steady.

12

Measures That Are Deteriorating

- Reports and substantiations of child abuse or neglect are up dramatically in the state. To the extent that these increases reflect greater family dysfunction and harm to children, we must be concerned with enhancing efforts to prevent child abuse and neglect and support families. In part, the increase in substantiated reports reflects changes in the state's definitions and policies that we believe will ultimately be positive in that the response to child abuse and neglect will be strengthened.

- Juvenile court filings are up in Kansas. Both the behavior of youth and the community's tolerance for and response to deviant behavior affect this measure. The wide variance in this measure and its trends across different counties combined with the wide variety of juvenile offenses captured in this measure call for more local analysis and search for appropriate responses.
- Reductions in childhood poverty are not being achieved despite a sustained period of economic growth in the state.
- In 1997, 6.9 percent of Kansas births were low-birth-weight babies, compared to 6.1 percent in 1985. This 13-percent increase means an even greater percentage of babies are predisposed to a variety of neuro-developmental disorders as well as weaker health conditions and negative cognitive outcomes.

What You Can Do

The measures showing significant improvement are cause for celebration, but we must not lose sight of the measures that are deteriorating. Awareness of the negative trends in those indicators provides us with the opportunity to make a difference in our own communities, as well as at the statewide level. Use the KIDS COUNT data to gain a better understanding of the specific issues affecting your county and join with others who have similar concerns. Determine your community's strengths and needs and become involved with changing public policy to respond positively to the data. Get to know your legislators and communicate your concerns to them; monitor the progress of legislation that affects children and families in Kansas.

Contact Kansas Action for Children at (785) 232-0550 to be placed on the legislative update list (sent via e-mail, or by fax if e-mail is not available). For more information on children's issues, visit the Kansas Action for Children website at www.kac.org.

Do your part to make KIDS COUNT in Kansas!

13

Does Kansas still have a safety net for our most vulnerable children? Has Kansas reformed welfare in ways that enhance the economic self-sufficiency of families and the well-being of children, or are we turning our backs on poor children? The truth is that we do not have good data to tell us what is happening to the children of families who are no longer on public assistance. What we do know is that two-thirds of all cash public assistance clients are children, and more than 23,000 Kansas children lost their cash assistance from 1996 to 1998.

The Historical Children's Safety Net. The concept of a safety net to catch the most vulnerable citizens in times of genuine need and provide for basic needs and physical safety has been accepted public policy for decades. With regard to children, that safety net has historically been made up of two distinct systems.

The first system deals with the needs of children at risk of abuse or neglect and has traditionally been referred to as the "child welfare system." Four distinct functions make up the Kansas child welfare system: the investigation of allegations of child abuse and neglect, or child protective services; family preservation services; foster care programs; and adoption services.

The second system is the group of public entitlement programs designed to address the needs of children at risk of extreme poverty. This second group includes traditional public assistance programs of cash assistance, food stamps, medical assistance, and child care programs, all of which are based on income eligibility.

Together, the child welfare system and the historic system of public entitlements wove a web of support and safety for vulnerable children. That safety net not only attempted to protect children from physical harm but also from limitations on their growth, development, and potential life success related to their poverty status, particularly during the first three years of life.

Recent Reforms. Over the past two years, Kansas has made dramatic changes in both sides of the safety net for vulnerable children. In the child welfare system, family preservation, foster care, and adoption services have been privatized and a managed care tool known as "case rates" has been instituted. Of the four child welfare functions, only child protective services remains a state-operated function.¹

Here we examine only the second child safety net system and how changes in those entitlement programs may affect children in Kansas. The federal law defining the second system and its primary component, the cash assistance program, changed dramatically under federal welfare reform legislation enacted in 1996. That federal law, known as The Personal Responsibility and Work Opportunity Reconciliation Act of 1996, ended our nation's 60-year-old guarantee of public assistance for America's lowest-income children and families.

The cash assistance program under the new federal welfare law is known as Temporary Assistance to Needy Families (TANF), shortened to TAF in Kansas. The TAF program is defined by work requirements, time limits, enhanced child support enforcement, and the promise of enhanced supports to aid welfare recipients in the transition from public assistance to gainful employment. As opposed to the old program of cash assistance (AFDC), which promised an unending entitlement to all families and children meeting income eligibility requirements, the new cash assistance program (TAF) provides cash assistance for a limited period of time only for those families with an adult willing to meet the work requirements.

Kansas Welfare Reform: Two Years Later. Recent news stories marked the two-year anniversary of the implementation of welfare reform. As evidence of success, state officials cite the volume of participants denied assistance or dropped off the cash assistance rolls under the new program eligibility standards and guidelines. However, of the 33,185 fewer Kansans that were on the state's cash assistance rolls in July 1998 than in July 1996, two-thirds—23,212—were children.²

What does welfare reform success mean from a child's perspective? The answer to that question will not be found in the reduced number of participants in cash assistance programs. For children, welfare reform success means that their families are moving off cash assistance and into the economic mainstream because a parent is consistently employed at a decent wage that can adequately provide for all the needs of the family.

Do the 23,212 children no longer eligible for the new cash assistance program meet that standard of success? Are they living in families whose income is sufficient to provide for basic needs, including food, shelter, clothing, health insurance and transportation? Are they safe from physical harm? We simply do not know because during the first two years of welfare reform the Kansas

Department of Social & Rehabilitation Services did not have tracking mechanisms in place to tell us whether these 23,212 children are better or worse off now than when their families were receiving cash assistance.

Child Poverty Indicators. The overall impact of welfare reform must be measured in broader terms than simply how many people are no longer welfare clients. We must look to general child poverty indicators to determine if the children of reform, both those moved off assistance and those who will be denied future assistance due to tighter program restrictions, have been placed at greater risk of poverty and its negative impacts.

The 1990 U. S. census identified 14.5 percent of (or 73,694) Kansas children living in poverty. The national KIDS COUNT project, which reports data each year for individual states as well as for the nation, shows childhood poverty rising in Kansas to 16 percent by 1994. Any potential impacts of welfare reform initiatives on state child poverty rates may not be clearly visible until the year 2000 census.⁸

Until then, data regarding eligibility and approval for free school lunches are the most encompassing measure of childhood poverty available. Children who are eligible for free lunches live in families with income no greater than 130 percent of the federal poverty standard.³ In the 1996 school year, nearly 25 percent of Kansas school children, or 118,921 students, were approved for free lunches. The number rose to 119,664 in the 1997 school year. By March of 1998, the number dropped slightly to 117,565.⁴ This measure of childhood poverty should be watched for developing trends.

Additional Indicators. A look at other public assistance programs indicates that the families of the 23,212 children falling off cash assistance are not accessing supports that may be essential for their health and economic well-being. SRS statistics for the same July 1996 to July 1998 comparisons for measures of participation before and after welfare reform reveal the following program changes:

Children on cash assistance	↓ 23,212
Children on food stamps	↓ 30,398 ^s
Children on medical assistance	↓ 11,279
Children receiving child care subsidy	↑ 929

16

Many of the families no longer receiving cash assistance are probably eligible for non-cash assistance such as food stamps, medical assistance, and child care subsidies. The drop in users of non-cash assistance may indicate these families are not aware of their eligibility for these supports.

Poverty and Early Childhood. We now know that by age three a child's brain has achieved 90 percent of total growth and that a child's environment plays a key role in the development of his or her brain. In addition, we know that optimal early childhood brain development depends on (1) early, quality prenatal care; (2) positive, age-appropriate stimulation from birth; and (3) the opportunity to develop warm and loving relationships.⁶ Early childhood also appears to be the stage in which family economic conditions matter the most. Research has proven that poverty adversely affects cognitive and behavioral development and thereby reduces opportunities for success and happiness in adulthood.⁷ Poverty in early childhood may have a more important effect on child development and may have more long-lasting effects on child development than poverty occurring later in childhood. In early childhood, mental ability, personality, and physical development are most malleable.⁸

The importance of early childhood helps to focus attention on a critical policy issue for Kansas: Should there be a safety net for vulnerable families with children? We believe that welfare reform will succeed only if there is a safety net for families with children. If we turn our backs on the most vulnerable families, we may continue to "succeed" in further reductions in the numbers of persons on cash assistance. We will not succeed in the long run because as a society we will reap the consequences of a generation of children growing up in poverty.

The question remains: What has happened to the children affected by welfare reform? Have they fallen out of the economic side of the safety net and into the child welfare system? Are their families experiencing increased income due to stable employment of the parent at an adequate wage? Have their families fallen off the welfare rolls and deeper into poverty, with the prospect of an even more devastating future for the children? At this point, we simply do not know.

Recommendations for Strengthening the Safety Net. In order for the Kansas welfare reform effort to be truly successful, we must incorporate measures to strengthen the safety net for families moving from welfare to

work so they can achieve economic self-sufficiency. Following are several examples of such measures:

- ❖ Kansas needs a *confidential tracking system* that identifies not only existing cash assistance clients but applicants for such assistance. Trends should be analyzed as to the number of and reasons why applicants and clients cycle on and off assistance. Data are already collected for the reasons applicants are denied assistance. In addition, a system for tracking former welfare families is needed to determine if they are achieving economic self-sufficiency, or if they are falling deeper into poverty, to the detriment of their children.

The *earned income eligibility standard* must be raised. A minimum-wage job for a mother with two children will not fund the basic necessities, but it makes her ineligible for TAF assistance. SRS' own cost-of-living study shows that a three-person family needs \$1,173 take-home pay monthly to make ends meet, but the TAF income standard for that family is \$745 gross income.

- ❖ *Child support* is a vital income support for all families, but especially low-income families. SRS has child support cases for more than 160,000 Kansas children; barely one-half of the current child support is collected. SRS needs adequate staffing to establish timely child support orders and an information system to monitor and update the orders.

Quality employment training is the long-term solution to economic self-sufficiency for families. SRS has adopted the policy that it will not fund such training. If this is not SRS' responsibility, Kansas lawmakers must decide whose charge it is and delegate the responsibility to the appropriate agency along with adequate resources.

A safety net of measures designed to help families become economically self-sufficient is vital if welfare reform is to succeed. We must ensure that Kansas' most vulnerable children are granted every opportunity we can afford them to grow up to be healthy, productive adults.

¹ "Privatization of Child Welfare Services in Kansas: A Child Advocacy Perspective." Kansas Action for Children. Topeka, Kansas. September 1998.

² Data Source: SRS comparison of July 1996 monthly count of AFDC recipients with July 1998 monthly count of TAF recipients.

³ The estimated poverty threshold for 1997 was \$12,873 for a family of three and \$16,485 for a family of four. The estimates are based on the 1995 U.S. Census Bureau poverty thresholds adjusted for estimated inflation.

⁴ September 1998 free lunch statistics were not yet available from the Kansas Department of Education at press time. Counts cited for all three years were obtained in March.

⁵ Estimated number based on historical estimates that one-half of the persons on food stamps are children. 165,000 Kansans were on food stamps in July 1996 and 104,204 were on food stamps in July 1998 for a decrease of 60,796 persons. Of that total, roughly half, or 30,398, were children.

HOW TO USE THIS BOOK

Purpose of Kids Count. The KANSAS KIDS COUNT Data Book is intended to draw attention to the status of children in Kansas. The goal of KANSAS KIDS COUNT is to compile data on indicators of the well-being of the state's children and to use these data to strengthen strategic action on behalf of children. The book provides descriptive information with regard to five areas of child and family functioning: (1) economic conditions, (2) physical health and safety, (3) child care and education, (4) emotional functioning, and (5) social behavior and social control. Statewide and poor-county data are provided on 22 different indicators of child well-being. The book is produced annually with current and retrospective data. By providing these data, the book is expected to motivate and encourage advocacy for children, to inform and therefore to enhance planning, and to assist in evaluating progress toward improving the lives of our children.

Structure of the Book. Around each book we have developed a theme to draw the readers' attention to current issues, research, and policy that impact children in Kansas (see pages 5-9). A narrative overview of the findings of the book is provided in an Executive Summary (page 4). The reader who is interested in a particular area of child well-being (e.g., physical health and safety or child abuse and neglect) will find data organized by indicators in the first part of the book (pages 12-55). If you are interested in a specific geographic area, you will find the data and graphic displays for each county in alphabetical order on pages 58-162. A profile for the entire state on all indicators can be found on page 57.

Selection of Indicators. The selection of data for the annual Data Book is an ongoing process. Prior to production of the first book in 1993, the project engaged in an extensive process for selecting indicators, which included reviewing KIDS COUNT books and related publications from other states, consultation with national KIDS COUNT staff and consultants, and guidance from two committees of Kansas advisors composed of academics, agency administrators, advocates, funders, judges and members of the state legislature.

It is important to the KANSAS KIDS COUNT project that as many indicators as possible reflect "outcomes" for children. We prefer to measure what end result has been achieved for children rather than what activity has occurred or what services children have received. For example, the percent of children in poverty is a preferred measure as an "outcome" for children rather than the percent who receive economic assistance from state agencies, which at times may not reflect the actual need for assistance resulting from living in poverty conditions.

Many times preferred indicators cannot be constructed because data are unavailable or of poor quality. Outcome information is more difficult for agencies to collect, so we are sometimes forced to use the more readily available service provision information.

Some data may not be collected annually or may only be available as a statewide measure and not available for individual counties. In all cases we have attempted to obtain the best and most complete data available. When using service data we have attempted to limit our selection of indicators to service programs for which there is some evidence of the effectiveness of the intervention. We have, on several occasions, decided not to use data because of questions regarding the quality of the data. We see as part of the mission of KIDS COUNT the need to draw attention to unavailable and poor-quality data in order to motivate and assist in the improvement of data collection for monitoring the well-being of children in Kansas.

Data Sources. The KIDS COUNT project does not have sufficient resources to engage in primary data collection. Data for the KANSAS KIDS COUNT Data Book are compiled by researchers at the University of Kansas, who obtain the data from other agencies and data archives. A full description of these sources is provided on pages 163 and 164. The individuals working in collaborating agencies that have helped to make this effort possible are acknowledged on page two of the Data Book.

Calculating Indicator Rates. All indicators are expressed as rates. A rate is the number of times some event occurs divided by the number of possible times it could have occurred. This ratio is typically multiplied by some factor of ten to produce whole numbers rather than a decimal figure. The most common form of a rate is a percentage. For example, the childhood poverty rate is the number of children whose families' income falls below the poverty level, divided by the total number of children in the population, times 100. More simply stated, it is the percent of children in poverty or the number of children in poverty per 100 children in the population.

For many indicators, the incidence of the event of interest occurs much less frequently and a typical rate might be some fraction of a percent. Typically in these cases the rate may be expressed as the number per 1,000 (e.g., infant mortality rate) or even per 100,000 (e.g., childhood death rate). A detailed description of the calculation of each indicator is provided in the Data Notes and Sources section of this book on pages 163 and 164.

Rates are not reported for each indicator in each year for some counties. These missing data result from several sources. Sometimes data were simply not available for certain counties. On several occasions, available data were judged to be of poor quality and were not reported.

For some indicators a county rate might not be calculated because it was judged not to be "meaningful." The last situation arises primarily in counties with small populations and with indicators that have low incidence rates in the general population.

Any county that experiences at least one occurrence of an indicator event (e.g., an infant death) has a rate calculated. To judge whether a zero occurrence was meaningful, we first calculated the expected frequency of the event in a given county based on the rate for the state as a whole. If the expected frequency is less than one, we do not report the rate and thus list only a “•.” In this case, we are saying that there are simply too few occurrences of the event (e.g., births) due to small population numbers to have any expectation of the event in a single year.

If the expected frequency is less than one and the county experiences one or more occurrences of the event, we calculate and report a rate. In this case, we are saying that the event would be unlikely to occur in this county due to the small numbers of people and the fact that it did occur is noteworthy. Nevertheless, many of these rates are based on very low occurrences of the underlying event and, as a result, may experience dramatic swings from year to year.

Interpreting the Data. This report provides several ways to judge the indicator score for a particular county. Decile scores rank the counties into ten equal groups, thereby providing a comparison of a county relative to all other counties in the state. For all indicators, low decile scores indicate that the county does well compared to others while high decile scores indicate that the county does relatively poorly. A decile score of “1” indicates that the county is in the top ten percent while a decile score of “10” indicates that the county is in the bottom ten percent.

A county’s indicator score can also be compared with the state average or mean score. In this way, one can see if the county score is better or worse than the average for the state as a whole.

Given the wide diversity in demographics across the 105 Kansas counties, it may also be helpful to compare your county with other specific counties that you judge to be similar with respect to important variables such as total population, income or geographic area.

In addition, it is important to compare current county indicator scores with past performance to determine whether the situation is improving or getting worse for a specific indicator. The *Data Book* provides a way to judge changes over time by producing “current” and “base” rates on each indicator where sufficient data are available. Current-year data are provided for the most recent available year. When available data permit, the base-year rate will be the average rate for the five years preceding the current year. Percent change over time is presented for all indicators with base-year and current-year data. On the county pages a bar graph is presented where these percent change scores have been converted to indicate “better” or “worse” trends over time.

Cautions In producing the *Kansas KIDS COUNT Data Book*, we are continuously faced with decisions about the quality of the data we are able to obtain and how best to present the data to provide an accurate and useful picture of the status of children in our communities. Our experience has convinced us that annual county-level data are the most relevant to community interests and decision-making processes in Kansas. However, Kansas has a relatively small population and many more counties than most states. This makes it difficult to construct reliable rates at the county level for many of our indicators and may make it impossible to accurately discern trends in the annual data. To address these issues it is always important to recognize when a rate is based on very few incidents. For example, a childhood death rate may be calculated based on only two deaths in a year. If in the baseline period the county experienced on average only one death every two years, this will show up as a 400-percent increase. While the math behind this calculation is accurate, this increase is not reliable and would be judged to be “statistically insignificant.” However, a child’s death is not an “insignificant” number. We still feel that it is important to draw attention to that death to stimulate local interest and discussion. What was the cause of these two deaths and could they have been avoided? In cases like this, our recommendation is to focus on the number of incidents involved rather than the rates.

Because of the time required for our data sources to collect the indicator data and the time required to produce the book, the 1999 book contains data dating back to 1998 or even 1997. The reader is cautioned to check each indicator to determine the exact time period being reported. This information can be found in the tables and in the Data Notes and Sources section of this book. It is possible that more recent data on a particular indicator are now available and can be obtained from the sources listed in the book.

As always, we invite your feedback about the *1999 KANSAS KIDS COUNT Data Book* and input regarding future productions of the book.

The availability of emotional, social, and economic support for first-time mothers is a key component to their transition into parenthood. Teenage mothers often lack this valuable support. Research reveals that teen mothers suffer from depressive symptoms at notably higher rates than other mothers. For some teens, these symptoms persist beyond the child's first birthday.¹ The demands of fulfilling a parental role often interferes with the teen mother's opportunity for peer relationships as well as the opportunity to develop her own sense of self-identity, a critical developmental process for many individuals during their adolescent years. Motivation to continue their academic education or pursue job opportunities may also be affected by parenting responsibilities. For many teen mothers, the absence of emotional and financial support from the baby's father contributes to high stress levels and economic hardships. This often affects their children as well. Studies have shown that, during their preschool years, children born to teenage mothers tend to begin exhibiting delays in cognitive development. In comparison to children born to older mothers, those born to teenage mothers appear to have higher levels of aggression, which often lead to negative outcomes during their adolescent years.²

In 1997, 9.8 percent of all live births were to unwed females under the age of 20, a five-percent increase from the average percentage of births to teens for the previous five years. Since 1992, the actual number of teen births has risen annually. Compared to the average number of teen births for the previous five-year period, there were six percent more teen births in 1997. Teen birth rates presented in the national *KIDS COUNT* book are based on the number of births to teens per 1,000 females, ages 15-17, regardless of marital status. By this definition, the teen birth rate for Kansas has increased seven percent from 1985 to 1995, while the national rate shows an increase of 16 percent. In 1995, Kansas ranked 22nd (highest/best rank = 1, lowest/worst rank = 51), with a rate of 30 births per 1,000 teens. Compared to some of its neighboring states, Kansas ranked worse than Iowa and Nebraska, yet better than Missouri.

Perhaps the single most important indicator of the well-being of children is the percentage of children living in poverty. Poverty has been found to be linked to a number of undesirable outcomes for children, including health, education, child abuse and neglect, delinquency, and emotional well-being.¹ Despite the recognized importance of this measure, it remains impossible to obtain current, county-level data or even estimates from any federal or state agency. The 1993 estimates provided here are the best available childhood poverty data at this time.

A recent press release from the U.S. Census Bureau heralded the news that "three years of positive growth in real median income have restored household income and poverty rates to their 1989 pre-recessionary levels."² Further reading of this press release, however, reveals that the poverty rate for children in 1997 was virtually unchanged from the previous year. Children typically suffer higher poverty rates than the general population. In 1997, the poverty rate for the nation as a whole stood at 13.3 percent while for children it was 19.9 percent, 50 percent higher. Children also seldom share fully in the country's economic prosperity. It is remarkable that during the economic boom of the mid-1990s, one in five children in the nation remained in poverty, a rate 50 percent higher than the next highest rate when compared to 17 other developed countries.³

The childhood poverty rate in Kansas is lower than the national rate and ranked 17th nationally in 1995. The rate appears to be steady over the last five years. The estimated childhood poverty rate in this year's book is 17 percent higher than the estimate provided in last year's book. This likely reflects the fact that the estimate last year did not include children less than five years of age and families with younger children are at higher risk of poverty. In Wyandotte County, one in three children are estimated to be living in families with incomes below what most authorities and the public consider to be an unrealistically low federal standard for poverty.⁴

Arguably, the single most important determinant of child well-being is family income. Children who grow up in poverty are at much higher risk of suffering various negative outcomes including other indicators described in this book. A direct measure of poverty at the county level on an annual basis is not available from other data sources. Approval for free school meals is based solely on family income with the eligibility standard tied to federal poverty levels. For this reason, the percent of children approved for free school meals can serve as a good proxy measure for childhood poverty. From this perspective, which is the intended use of the measure here, higher levels of children approved for free school meals can be viewed as an indicator of worsening economic conditions for children and families in the community.

For Kansas, the percentage of children approved for free school meals has held steady for the past two years and shows only a slight increase in 1998 compared to the average for the previous five years. While this could be viewed as good news, or at least not bad news, it should be noted that this plateau is at a relatively high rate and has not declined during a period of extreme economic prosperity in this country and state.

While increases in this measure are viewed here as a sign of worsening economic conditions for children, we must emphasize that full participation in this program for all eligible children is highly desirable. Results from a recent large-scale study in nine states suggest that hungry and at-risk-for-hunger children were twice as likely as not-hungry children to be classified as having impaired functioning. Teachers reported higher levels of hyperactivity, absenteeism, and tardiness.¹

This measure is the percentage of all children who are receiving cash assistance, medical assistance, or food stamps. As discussed more fully in the opening section of this book, Kansas and other states have experienced a major drop in the number of welfare recipients that can be traced to the welfare reform legislation enacted in 1996. This trend continues in our current measure with the percent of children receiving economic assistance dropping from 16 percent in the baseline years of 1993-1997 to 13 percent in 1998. This represents a drop of nearly 10,000 children in the last year alone. Since 1996, the number of children in Kansas receiving only cash assistance has dropped by more than 23,000. The number receiving food stamps has shown an even more dramatic decline of more than 30,000, while the number receiving medical assistance has declined more than 11,000.

These dramatic declines are being touted by some as an indication of the success of welfare reform. In reality, welfare reform means the elimination of an economic safety net for families. The impact of this major policy change on those families and their children is largely unknown at this time. In the opening section of this book, we argue that other poverty indicators like the percentage of children approved for free school meals and childhood poverty rates are not showing similar declines. The harmful effects of poverty on children are well documented. If economic assistance is removed and poverty remains, children and families — and ultimately the future for Kansas — will suffer.

Injuries have surpassed infectious diseases as the greatest threat to children.¹ Motor vehicles are the leading cause of trauma deaths for children.² Over the last three years, 28,000 Kansas children, ages 0 to 14, were killed or seriously injured in motor vehicle accidents.³ Available data reveal that 71 percent of motor vehicle deaths for children under five years of age could have been avoided with proper use of a child-restraining device. Other data indicate that while 56 percent of five-to nine-year olds and 66 percent of ten- to 14- year-olds are front-seat passengers, approximately 77 percent and 83 percent, respectively, are improperly restrained or fail to wear a seat belt.⁴

The childhood death rate is based on the number of deaths of children ages one to 14, from all causes, per 100,000 children in this age group. From 1985 to 1995, a 31-percent decline in the Kansas childhood death rate can be seen.⁵ In 1997, the Kansas childhood death rate improved 7.4 percent from the base-years period. Wyandotte, Johnson, and Douglas counties celebrated noticeable declines. This year, approximately 33 percent of Kansas childhood deaths were attributed to motor vehicles, fires in private dwellings, firearms/explosives, and accidental drowning.⁶ Sadly enough, some children died of health conditions that are incurable at this time; however, the majority of childhood deaths caused by injuries most likely could have been prevented.

Mortality data are from the Kansas Department of Health and Environment. Childhood mortality rates represent the number of deaths per 100,000 children age 1-14. Population data are estimates made by the U.S. Census Bureau. Negative change scores indicate improvement. As a result of rounding, counties with identical rates may receive different decile ranks.

* Rates are not calculated for counties with too few children for meaningful interpretation.

* Zero events in the base years prevent calculation of percent change scores.

The infant mortality rate represents the number of deaths of children under one year old per 1,000 live births. From 1985 to 1995, Kansas celebrated a 25-percent improvement in its infant mortality rate. An improvement of 8.4 percent can be seen when comparing 1997 to the previous five-year period. Based on the most recent available national data, Kansas ranked 17th in 1995, a tremendous improvement from two years earlier when the state ranked 33rd.¹ Fifty percent of all Kansas counties with percent change rates show improvement from the base-year period. Among the more populated counties, three show significant declines in infant mortality rates: Riley (-78 percent), Butler (-57 percent), and Douglas (-50 percent). Reno, Leavenworth, and Wyandotte counties also showed noticeable improvement.

In 1996, more than 50 percent of all infant deaths in the United States were attributable to four major causes: birth defects, disorders related to premature birth and low birth weight, sudden infant death syndrome (SIDS), and respiratory distress syndrome.² Advances in public health and clinical medicine have played a key role in the decline of the country's overall infant mortality rate. However, the rate of infant deaths attributed to birth defects, which are the leading cause of infant mortality, has failed to decline as rapidly as the overall infant mortality rate. A recent report identified a correlation between poverty and high incidents of infant deaths associated with birth defects. This finding suggests that access to health care services may be a critical factor in the declining rate of infant deaths associated with birth defects.³ The infant mortality objective set for Year 2000 is to accomplish an overall infant mortality rate of seven per 1,000 live births.⁴ Successfully able to achieve a rate of seven in 1995, Kansas can achieve that rate, or do better, in the future.⁵

BIRTHS WITH EARLY PRENATAL CARE

Births with early prenatal care represent the number of live births in which the mother started prenatal care within the first three months of her pregnancy. Compared to the base-years period, there has been a slight increase in the overall percentage of Kansas women seeking prenatal care. Graham and Lane counties successfully accomplished a 100-percent rate for the year. A serious concern is raised for counties such as Finney, Ford, and Haskell, where the prenatal care rate was less than 70 percent during the base-years period and has declined further in 1997. The significant percentage decrease for Kiowa, Lincoln, and Scott counties is also troubling. Compared to their base-years period, Kiowa County's early prenatal care rate declined from 86 percent to 66 percent, Lincoln County from 93 percent to 73 percent, and Scott County from 79 percent to 62 percent.

For many women, especially first-time mothers, early prenatal care is an important component to their pregnancy experience. In addition to building a trusting relationship with their physician, women learn about healthy eating habits and proper exercise, which support a healthier pregnancy outcome. Early prenatal care can also provide for early detection of possible complications for the baby. A recent study indicated an association between less than adequate prenatal care utilization and decreased numbers of well-child visits, as well as less than complete DPT and polio immunizations.¹ In view of the overall benefits of early prenatal care, it is important for Kansas counties to explore ways to increase access and utilization of prenatal care services.

Childhood vaccinations are recognized as the most cost-effective way to prevent certain infectious diseases. Yet, many children do not receive all recommended vaccinations. The results of a study conducted in the Midwest revealed that children of mothers who failed to receive proper prenatal care, who are in poverty, and who are single parents are less likely to have their full complement of vaccinations by the age of two.¹ While socioeconomic factors were identified, the study recognized that other factors, including structural barriers, are also associated with failure to receive adequate vaccinations for children by age two.

This measure is the percentage of Kansas children in kindergarten who were adequately immunized by age two based on a retrospective survey of immunization certificates at the time of enrollment for kindergarten. Compared to the previous five-year period, Kansas celebrated a 23-percent improvement in 1997. All but two counties (Lincoln and Stanton) showed an increase. Twenty-two percent of Kansas counties had a positive percent change of 50 percent or greater. Greenwood is applauded for showing the greatest improvement, with a 93-percent change. Likewise, 96 percent of all kindergartners in Comanche County were immunized by age two, the highest rate in Kansas. The remarkable improvement in the percentage of Kansas kindergartners who were fully immunized by the age of two places the state closer to achieving the nation's Healthy People 2000 goal of 90-percent immunization of all two-year-olds.²

Data are from Kansas Department of Health and Environment. Rates are percentage of kindergartners who were fully immunized by age two, based on a retrospective survey of immunization certificates. No survey was conducted in 1992. As a result of rounding, counties with identical rates may receive different decile ranks and counties displaying identical base and current year percentages may have a non-zero percentage change. The number of children immunized is derived from the immunization sample data and kindergarten enrollment figures.

According to the national *KIDS COUNT* data, the percentage of Kansas live births weighing less than five pounds, eight ounces increased five percent from 1985 to 1995. On the national level, there was a seven-percent increase for the same time period. In 1985, 6.1 percent of Kansas births were low-birth-weight babies, compared to 6.9 percent in 1997. This 13-percent increase means an even greater percentage of babies are predisposed to a variety of neurodevelopmental disorders as well as weaker health conditions and negative cognitive outcomes. Low-birth-weight infants are 25 times more susceptible to cerebral palsy than other infants.¹ On intelligence tests, low-birth-weight children score significantly lower than their peers.²

Improvements in medical care for pregnancy and delivery over the past 30 years have had little impact on the percentage of births that are low birth weight in the United States.³ As noted by some medical doctors, merely increasing the utilization of prenatal care does not necessarily guarantee more positive pregnancy outcomes.⁴ For low-income women, improvements in their stressful and impoverished environment as well as access to adequate resources are more critical. Social and environmental disadvantages also appear to have far greater negative effects on the long-term cognitive outcomes for low-birth-weight children than most biological risk factors. These cognitive defects become more obvious as the child ages.⁵

Children between the ages of three and five from families that meet the federal poverty guidelines are eligible for Head Start services. The Head Start combination of direct intensive services to children and referrals to supplemental services reflect the best research and evaluation of how to achieve effective and long-term results for children and their families. In 1998, Head Start will benefit approximately 830,000 children and their families nationwide, including about 38,000 low-income infants and toddlers in Early Head Start. With the Balanced Budget Act of 1996, Head Start will reach President Clinton's goal of serving one million children in 2002.¹

Our indicator is the number of Head Start slots available for every 100 three-to-five-year-olds in the population whose family income is below the poverty level. This indicator has shown steady improvement in Kansas over the past five years. The overall rate for the state continued to increase in 1998, climbing 17 percent over the average for the previous five years. Cheyenne, Coffey, Kingman, Marion, Norton, Phillips, Pottawatomie, Rawlins, and Smith counties all started first-time programs in 1998. On the other hand, Brown, Jackson, Sedgwick, Sheridan, and Wabaunsee counties experienced significant declines in available Head Start slots for children in poverty. Hopefully these communities will be able to start new programs in the coming year.

¹Head Start Bureau. (1998). Evaluation of the Comprehensive Child Development Program.

Head Start data are from the U.S. Department of Health and Human Services. Poverty estimates are created from U.S. Census estimates. Population data are estimated by the U.S. Census. Positive percentage changes indicate improvement.

An * indicates the Head Start Program is new for this county in 1998 and calculation of percent change from base years is not possible.

Two major trends have combined to make affordable, accessible, reliable, caring and stimulating child care an even higher priority for our families and children. While fathers play a critical role in the care of children, it is mothers who have provided and continue to provide the bulk of child care in our society. Labor force participation among women with preschool-age children has increased from 39 percent in 1975 to 62 percent in 1996 and is estimated to reach 70 percent by the year 2000. As a result of federal and state changes in welfare eligibility requirements, millions of welfare recipients, primarily women with children, are now expected to find and keep jobs, further increasing the demand for quality child care. The development of child care was thought to be of such importance that it was chosen as the central focus of the 1998 national *KIDS COUNT Data Book*.

In Kansas, 65 percent of the mothers with children under age six and 79 percent of the mothers with children six to 17 years of age were in the labor force at the time of the last census in 1990. It is estimated that about 56 percent of children under the age of 13 are likely to need child care while their parents work. In Kansas that would translate into more than 260,000 children in need of child care. The percentage of children receiving economic assistance has fallen from 19 percent in 1994 to 13 percent in 1998 as a result of restrictions in welfare eligibility. Many of these children will now require child care as their mothers move to employment outside the home.

The availability of child care in Kansas continued to make slight increases in 1998. However, the number of slots available per 100 children under age 13 varies from fewer than 15 for the lowest ten percent of counties to more than 35 for the highest ten percent. Such a wide range can only mean that child care options are extremely limited for many children and families in Kansas.

Data are from the Kansas Department of Health and Environment. Child care capacity includes the number of registered day care homes, licensed day care homes, group day care homes, child care centers, and preschools as of June 1994 through June 1998 for base years and current year June 1998. Population data represent the number of children under age 13 estimated from the the U.S. Census.

Post-secondary education or training refers to enrollment at a non-college institution, two-year college, four-year college or university, or other type of college. School districts' annual survey of high school graduates from last year's graduating class revealed that there was a slight increase, from the base-years period, in the overall percentage of Kansas graduates enrolled in post-secondary education or training, five to six months after graduation. Geary County showed the greatest improvement with a 34-percent increase. Chautauqua had the largest decline with a 29-percent decrease. Among the most populated counties, Wyandotte County showed the greatest improvement with eight percent more high school graduates pursuing post-secondary education or training. Compared to their previous base-years period, 40 Kansas counties experienced a decline in 1997 compared to 17 counties in 1996.

For many individuals, post-secondary education provides for a wider range of career options and greater financial rewards. With increased technological advances in the workplace, a higher demand for skilled labor has emerged. Today, compared to 50 years ago, a high school education is considered a minimum requirement rather than an asset in the labor force.¹

Adults with post-secondary education are more likely to participate in the labor force (working or seeking employment) than those with less education. In 1996, approximately 81 percent of adults with a bachelor's degree, ages 25 and over, participated in the work force, compared with 66 percent of high school graduates and 41 percent of those with less than a high school degree. During the same year, the unemployment rate for those with higher education, 25 years and older, was 53 percent less than for high school graduates.² In 1992, the average annual earnings for male university graduates were 164 percent of the annual earnings for males with a high school diploma. For female university graduates, the average annual earnings were 170 percent of the annual earnings for female high school graduates.³

The challenges confronted by women who have dropped out of high school extend far beyond personal embarrassment. With less than a high school education, many of these women are restricted to low-wage employment, which leads to other personal hardships as well. In 1997, the median annual income for women 25 years old and over with less than a high school education (\$8,861) was approximately 35 percent less than those with only a high school education or equivalent (\$13,407). For men of the same educational attainment, the median annual income was almost twice that of women.¹ As income rises, the likelihood of being uninsured declines.² However, chronic diseases are more prevalent among low-income women.³

The additional responsibility of providing for their children compounds the emotional stress and economic hardship for many women without a high school education, especially those who are single parents. Unfortunately, their children suffer as well. Children who live in single-parent households where the parent has less than a high school education are more likely to suffer from poorer health, to exhibit learning and behavioral problems, and to fail in school.⁴ This year there were 6,729 births to women without a high school degree, an increase of 161 from 1996. Among these women, 2,875 were under the age of 20. Compared to the previous five-year period, the percent of births to mothers with less than a high school degree was two percent higher in 1997.

Counts vary widely on this measure with reliable scores ranging from six to 50 percent. A high correlation can be observed between this measure and our measures of economic well-being for the counties. Just as having a child before completing high school increases the risk of the child growing up in poverty, low income is likely to increase the risk of teen births and failure to complete high school.

Completion of high school is a valuable educational accomplishment that serves as an entryway into the work force as well as further academic and training opportunities. Education is one of the most important factors that determines annual earnings that, in turn, are a direct link to one's socioeconomic status.¹ Significant differences can be seen between the median income of men, ages 25 and older, with a high school education (\$25,453), and those with less than a high school education (\$16,818). A dramatic difference in earnings can also be seen for women, ages 25 and older, with a high school education (\$13,407) and those without (\$8,861).² The 1996 unemployment rate for adults, ages 25 and older, with less than a high school education was 8.7 percent compared with 4.7 percent for those with a high school education.³ With numerous technological advances, the importance of completing high school has become even more critical for one's successful participation in the work force.

In 1997, the Kansas graduation rate was 81 percent. It is troubling to see that 51 Kansas counties suffered a decline in graduation rate from the previous year. Seven counties had a graduation rate of less than 75 percent: Allen, Cherokee, Finney, Wyandotte, Ford, Geary, and Sedgwick. Of these, the last three showed improvement from 1996 in graduation rates. Wichita County had the greatest decline with 15 percent. With a 19-percent increase, Meade County showed the greatest increase. The counties with the highest graduation rates are Cheyenne and Comanche, with a 98 percent and 97 percent graduation rate respectively. Finney County suffered the lowest graduation rate with 56 percent.

A survey based on data spanning a three-year period (1994-1996) showed that the Kansas high school completion rate, 91.6 percent, was higher than the national mean, 85.8 percent. Respondents ages 18 to 24 were recognized as having high school credentials if they received a regular diploma or passed a high school equivalency examination.⁴

Data are from Kansas State Board of Education. Rates are calculated by dividing the number of graduates by the sum of graduates and dropouts from grades nine through 12. Positive percent changes indicate improvement. Migration into or out of the school district between ninth and 12th grade may account for a proportion of increases or decreases in some rates. Currently there are no statewide data available that would allow for an accurate determination of the influence of migration.

Nearly 6,000 Kansas children and youth were in state custody and living outside their own homes at some time in the month of June 1998. The majority of these children were in placement through no fault of their own but as victims of abuse and neglect within their communities and families. While there clearly is a current and continuing need for out-of-home placement for some children and families as part of a continuum of care, there is also a sense that the continued need for placement in out-of-home settings represents a failure. It is a failure to prevent the abuse or neglect or behavior problems from occurring in the first place. It is also a failure to provide adequate and effective services to the child and family to maintain the child in the family and community of origin, and it may represent a failure to quickly find a permanent placement for the child through reunification or adoption.

In 1995, Kansas had the sixth highest out-of-home placement rate in the country.¹ Our data show that the rate has risen slightly since that time. In the last year, there have been some dramatic shifts in the use of out-of-home placements in some counties including some of the larger Kansas counties. Sedgewick, Finney, and Reno counties have experienced significant increases in the use of out-of-home care ranging from 33 to 77 percent. On the other hand, Johnson County reduced its rate by 23 percent and Wyandotte County cut its rate in half. This wide variation in experiences provides an opportunity to learn what factors are driving these differences and how this knowledge can be applied to keep children healthy and safe in their own homes.

Placement data are from the Kansas Department of Social and Rehabilitation Services. Population data are estimated from the U.S. census. An asterisk represents counties in which no children were placed out of the home for that year. Rates are calculated per 1,000 children age 18 and under.

TEEN VIOLENT DEATHS

Teen violent death is defined as deaths among youth, ranging in age from 15 to 19, caused by accidents, suicides, and homicides. A national school-based survey conducted in 1997 revealed that high-school-age students engage in behaviors that increase their likelihood of becoming a victim of teen violent death. During the 30 days preceding the survey, 19 percent of the students had rarely or never worn a seat belt, 51 percent had drunk alcohol, 26 percent had used marijuana, and 18 percent had carried a weapon. It also disclosed that eight percent of the students surveyed had attempted suicide during the 12 months preceding the survey.¹ The most recent national data indicate the Kansas teen violent death rate declined nine percent from 1985 to 1995 while the national rate rose three percent.²

In 1997, the Kansas teen violent death rate was 68.3 (per 100,000 teens), an improvement of 12.2 percent from the base-years period. Motor vehicle accidents were the leading cause of teen violent deaths with a rate of 35.6. Firearms were the second major cause with a rate of 22.3.³ For those Kansas counties with percent changes from the base-years period, more than 60 percent show a decline in the rate of violent deaths among teens. Caution should be used in interpreting dramatic rate increases for less populated counties like Edwards, Meade and Pawnee. Each of these counties had one teen violent death for the year while averaging only one death every two or more years.

Data are from the Kansas Department of Health and Environment. The base years consist of the average of years 1992 through 1996. Teen violent death rates represent the number of violent deaths per 100,000 children age 15-19. Negative change scores indicate improvement. As a result of rounding, counties with identical rates may receive different decile ranks. Population data are estimates made by the U.S. Census Bureau.

* Rates are not calculated for counties with too few children for meaningful interpretation.

** Zero events in the base years prevent calculation of percent change scores.

Newspaper headlines describing unbelievable horror stories of child fatalities resulting from the hands of parents or cases of extreme neglect or exploitation of children serve as all-too-frequent reminders of the personal tragedy of child abuse and neglect in our communities. But as horrible as these incidents are, they fail to describe the magnitude of the problem of child abuse and neglect as it impacts tens of thousands of other children and families in our state. Child abuse and neglect represents an extreme form of family dysfunction but also a serious social problem for our communities.

Based on an annual survey of child welfare officials in all 50 states and the District of Columbia conducted by the National Committee to Prevent Child Abuse, more than three million children were reported as victims of child abuse and neglect in 1997. This figure represents a 1.7-percent increase over the previous year. Nationwide, the rate of children reported for child abuse or neglect increased four percent during this period, from 45 per 1,000 children in 1992 to 47 per 1,000 in 1997. Overall, the total number of reports nationwide has increased 41 percent since 1988.

Kansas showed a dramatic increase of approximately 20 percent in both the number of reports annually and the rate of children reported in 1997 compared to the previous year. Data for this year's book were obtained from a new state data system and part of the increase in reports could be a function of better recordkeeping and processing. Because of data problems that existed through much of this decade, we have limited baseline data to compute trends in child abuse and neglect reporting. However, the 1997 rate of 47 per 1,000 children represents an 18-percent increase in the rate observed ten years ago in Kansas.

After a report of child abuse or neglect is investigated, the child protective service worker must make a finding. Prior to 1997 in Kansas a report was either confirmed or not confirmed. Kansas had very narrow requirements for confirmation resulting in one of the lowest confirmation rates in the country.

In 1997, Kansas changed its finding categories to "substantiated" and "unsubstantiated" and developed additional criteria for substantiated cases for entry into the Central Registry for perpetrators of child abuse and neglect. Previously the "confirmed" cases had to meet that higher standard for entry into the Central Registry and cases not meeting this standard were classified as unconfirmed. The new "substantiated" rate can now be counted to construct a more accurate picture of the actual occurrence of abuse and neglect in our state. In 1997, under the new procedures, Kansas confirmed or substantiated 41 percent of the reported cases of abuse or neglect (13,979 confirmed/substantiated cases divided by 34,172 reported cases).

No baseline data are available for this new measure, so we cannot speak to trends over time in this year's book. Nationwide the actual incidence of abuse and neglect is known to have increased over the past decade, nearly doubling between 1986 and 1993.¹ The new procedures in Kansas are believed to provide a more accurate picture of the scope of abuse and neglect in our state and will provide a basis for tracking trends in future books.

In the absence of a reliable source for juvenile offenses or arrests, KIDS COUNT began last year to report trends in juvenile court filings. This measure is a reflection of both the level of deviant behavior of children and youth in the community as well as the community's tolerance and response to this behavior. While this year's state rate of 24 per 1,000 children under the age of 18 is substantially higher than the average of 24 for the previous five years, it is down some from last year's rate of 27. Further monitoring will be required to see if this trend continues but it does appear to be consistent with related national data.

Over the ten years from 1985 to 1995, the juvenile violent crime arrest rate rose 66 percent nationwide and 45 percent for Kansas. However, there has been a decline in the rates for juvenile violent crime in more recent years.¹

Juvenile court filing rates continue to vary widely across Kansas' counties with some counties showing declines and others experiencing increases. These differences combined with the wide variety of juvenile offenses captured in this measure call for more local analysis and search for appropriate responses.

100

¹ Annie E. Casey Foundation. (1998). *KIDS COUNT Data Book: 1998*. Baltimore, MD.

102

Data are from the Kansas Bureau of Investigation. Juvenile court filing rates represent the number of court filings per 1,000 children under the age of 18. Negative change scores indicate improvement. Population data are estimates made by the U.S. Census Bureau.

					105				

More youth identify alcohol as their drug of choice than any other substance. Young people who use alcohol put themselves at risk for a host of negative consequences. Alcohol-related motor vehicle accidents are still a leading cause of death among 15-to-24-year-olds. The Centers for Disease Control estimates as many as 30,000 accidental deaths per year and 20,000 homicides or suicides are alcohol-related. Other studies find that underage drinkers have a greater likelihood of using other illicit drugs as well.¹

Our survey data this year report on the percentage of children in grades six, eight, ten, and 12 who report having used alcohol in the past month. In the most recent findings, 35 percent of Kansas youth responding to the survey indicated they had used alcohol in the past 30 days. This is a five-percent increase from the base years, an undesirable trend.

Research tells us that a high correlation exists between the availability of alcohol and its use by young people. National surveys of youth also indicate that they believe alcohol is more easily obtained than five years ago.³ As Kansas youth who are surveyed indicate greater use of alcohol, community leaders should ensure that their prevention activities include efforts to restrict youth access to alcohol.

				109		18

Binge drinking is defined as the consumption of five or more drinks in a row on at least one occasion. Clearly, the goal of binge drinking is intoxication, a very unhealthy approach to alcohol use for anyone and particularly dangerous for young people.

Binge drinking dramatically increases a youth's risk of serious injury or death through alcohol-related accidents or violence. Bingeing also increases the likelihood of poor decision-making regarding risk-taking and sexual behavior, choices which may result in long-term consequences.

National studies find that one-third of high school students report engaging in binge drinking in the last two weeks. Despite general declines in illicit drug use by youth, the 1997 Monitoring the Future Study found binge drinking increasing slightly in recent years.¹ Our data indicate similar results for Kansas children.

The data we provide here comes from a survey of young people in grades six, eight, ten, and 12. In the most recent year, 1998, we find that 19 percent of the children responding to the survey indicated they had engaged in binge drinking on at least one occasion. This is a slight increase from the base-year rate, a trend of some concern. Community leaders must remain cognizant of the risks posed by binge drinking and continue efforts to discourage this dangerous behavior.

Nationally, the use of drugs increased steadily through this decade before beginning to level off in the most recent year. A 1996 Substance Abuse and Mental Health Services Administration Study found that nine percent of youth ages 12 to 17 reported they were currently using drugs. Marijuana is the most frequently used illicit drug; well over 90 percent of youth who use drugs other than alcohol report beginning with marijuana.¹ Drug use among youth is associated with family, school, and legal problems. Children who use drugs are more likely to be sexually active and contract a sexually transmitted disease.

Our study data report on lifetime rather than current use of drugs. This represents the percentage of young people who indicate they have ever used a drug other than alcohol. Among children in grades six, eight, ten, and 12 who participated in the survey, 11 percent report at least one use of drugs in their lifetime. This figure is a substantial reduction from the 17-percent base rate and is certainly very positive news. While we applaud the positive change, we also caution that shifts in patterns of survey participation may account for some changes in reported use.

114

Drug use means use of any of the following: marijuana, cocaine, inhalants, or LSD. Among these, marijuana is the most frequently reported drug used. Data are provided by the Southeast Kansas Education Service Center from a survey administered to youth in grades six, eight, ten and 12. Counties in which less than 25 children per grade participated are not reported. State totals are from all survey respondents and include data from omitted counties.

Kansas has continued to improve dramatically in the rate of childhood immunizations and has also shown improvements in other indicators of physical health and safety. There have been declines in both the childhood death rate and infant mortality rate. The teen violent death rate was also down last year after peaking the previous year. In addition, Head Start has been made more available to children living in poverty in Kansas, which is expected to greatly benefit these children. Unfortunately, poverty levels and other indicators of economic well-being continue to be of concern, and reports of child abuse and neglect have risen significantly.

County Seat: Iola		

Allen County boasted positive improvement in the percentage of births with early prenatal care and dramatic improvements in immunization rates. Both were important contributors to long-term health of children. The availability of child care increased as well, another positive finding for this county. Of concern, both the graduation rate and the percentage of graduates pursuing post-secondary education declined slightly. Both remained below the statewide level.

(1997 data provided by Kansas Dept. of Human Resources, Labor Market Information Services)		
County Seat:	Garnett	

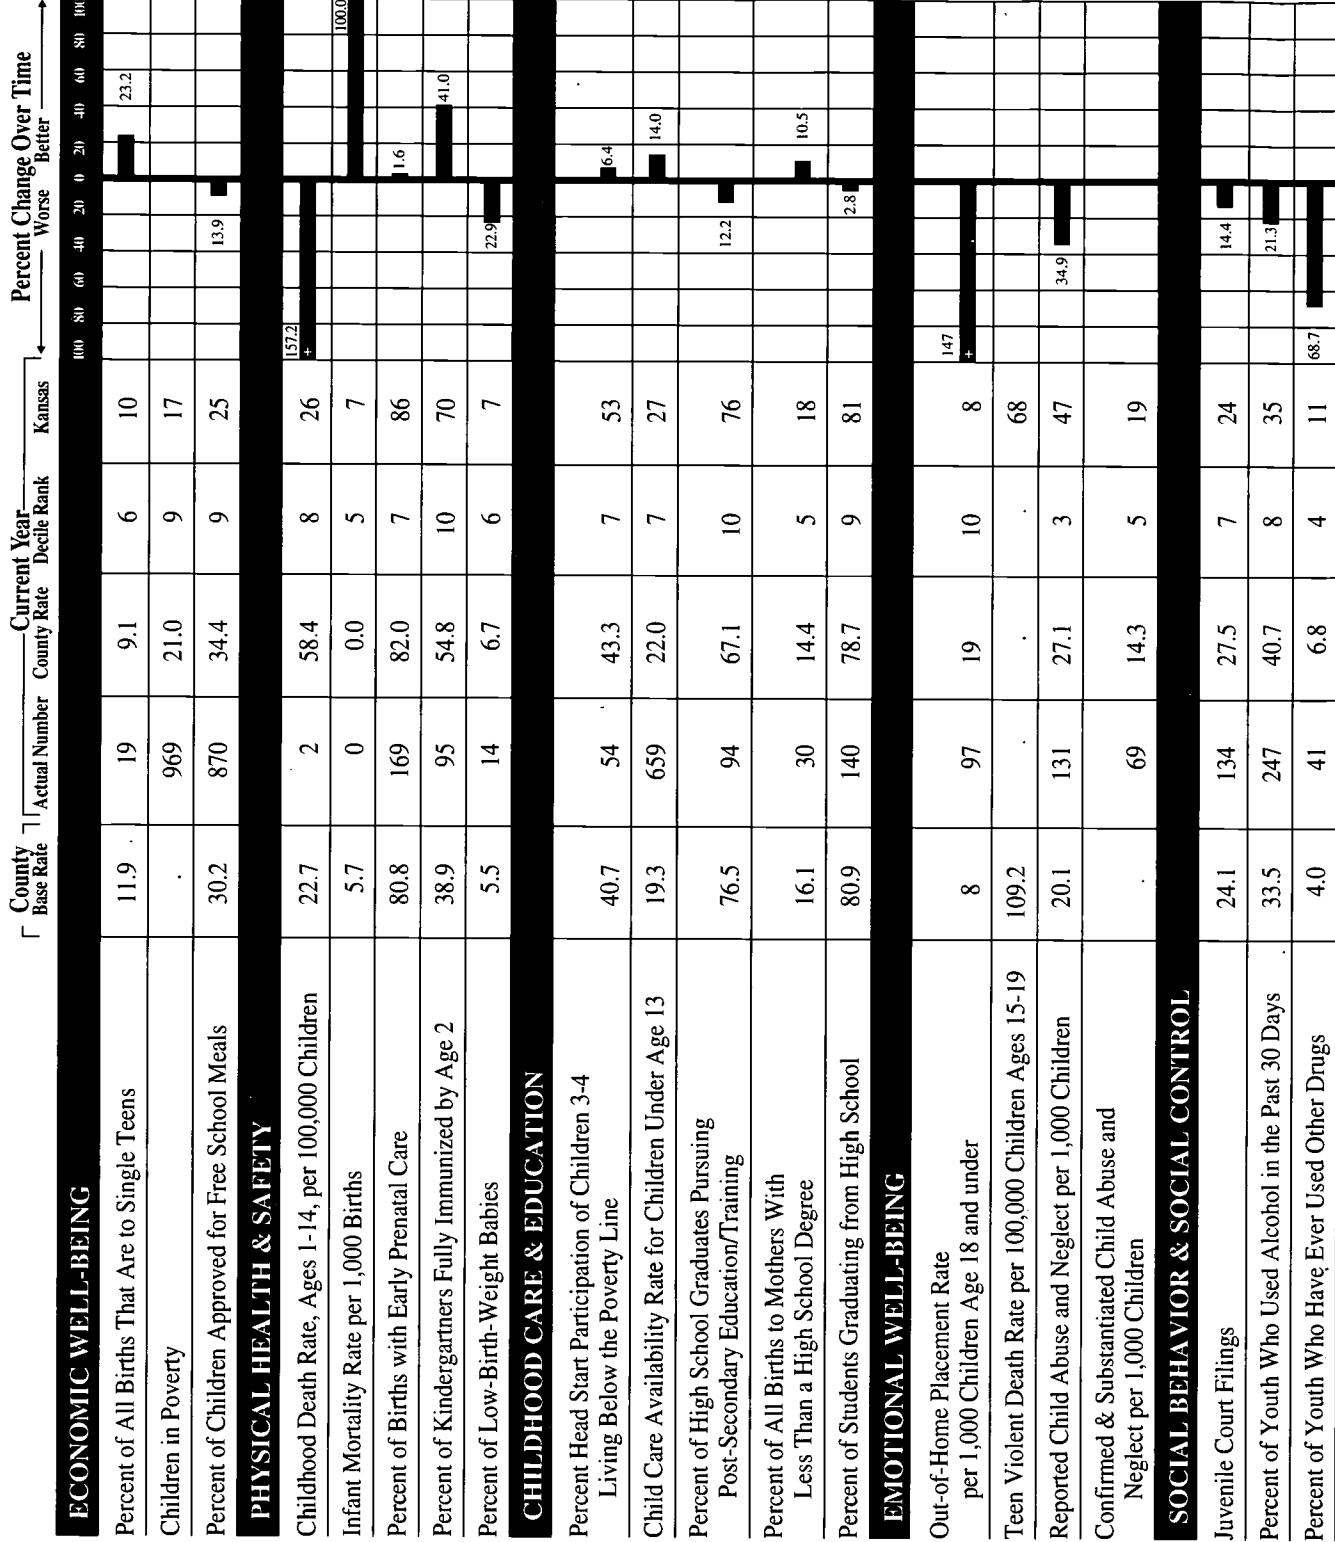

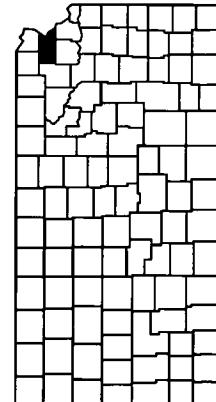

Anderson County achieved a reduction in the percentage of births occurring to single teens this year. This was good news as young mothers were more likely to drop out of school and to live in poverty. The high school graduation rate in this county remained above the state average. On the negative side, the out-of-home placement rate increased substantially, as did reports of child abuse and neglect.

Unemployment (1997 data provided by Kansas Dept. of Human Resources, Labor Market Information Services)	6.7%	3.8%
County Seat: Atchison		

Atchison County had a reduction in the percentage of births that occurred to mothers who lacked a high school degree and remained well below the state average for this indicator. This county also obtained a substantial increase in its immunization rate. Although there remained much room for improvement in immunization, this year's figure was a step in the right direction. Of concern, the percentage of Atchinson County high school graduates who sought additional education or training declined further this year.

 Barber County accomplished a big increase in the childhood immunization rate; the results for this year's rate were well above the statewide figure. Other good news included a further reduction in the percentage of low-birth-weight babies. The high school graduation rate remained among the best in the state despite a slight decline. An area of concern is the increase in the rate of juvenile court filings.

BARTON

	County	State
Population Size	29,382	2,477,574
Percent Population Under Age 18	27.0%	26.7%
Ethnicity		
White	95.2%	88.4%
Black	1.2%	5.7%
American Indian, Eskimo or Aleut	0.4%	0.8%
Asian or Pacific Islander	0.3%	1.2%
Hispanic Origin (All Races)	2.8%	3.8%
Median Family Income	\$28,969	\$32,966
Unemployment (1997 Data provided by Kansas Dept. of Human Resources, Labor Market Information Services)	3.2%	3.8%
County Seat: Great Bend		

Barton County citizens should be pleased with an increase in the percentage of its high school graduates who pursued additional education or training. That rate improved this year and ranks above the state rate. The rate of reported child abuse and neglect also declined in the current year. Of concern is the increase in teen mothers along with an increase in births to mothers who do not finish high school. Both phenomena may fuel the likelihood of long-term negative outcomes for mother and child.

County Seat: El Dorado

Butler County obtained a reduction in the percentage of births to mothers who have not completed high school. Other good news included a decline in births to single teenage mothers. On the negative side, the rate of child care availability declined this year and remained well below the state rate. Another concern is that Butler County also experienced an increase in low-birth-weight babies.

County Seat:	St. Francis		

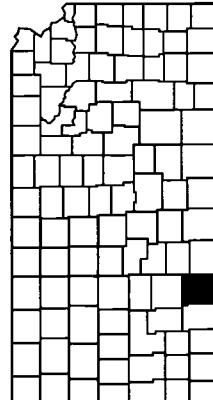

CHEYENNE COUNTY residents should take pride in educational achievement among its young people. The graduation rate increased this year and was among the best in Kansas. In addition, a very high percentage of Cheyenne County youth pursue additional education and training after high school. Although the immunization rate improved this year, it remained among the lowest in the state. Reports of child abuse and neglect increased this year as well.

Clark County citizens should celebrate its continuing excellent high school graduation rate. Clark County youth also seek education or training after high school at a high rate. This county also has a very low rate of juvenile court filings. On the negative side, there continues to be no Head Start program for children in Clark County, and the percentage of births with early prenatal care declined this year.

Cloud County should take pride in the improvement in child care availability. Already at a high rate, this county had one of the best rates in Kansas. Another positive finding for Cloud County was the percentage of high school graduates who sought further education or training. Of concern, juvenile court filings increased substantially this year and were well above the state rate. The percentage of low-birth-weight babies also increased this year.

Coffey County has good news in educational and economic areas. Compared to other counties, a relatively small percentage of children live in poverty. The percentage of births to mothers who lack a high school degree declined this year. Coffey County also began a Head Start program for its children this year. Of concern, a relatively high number of young people in Coffey County reported having used alcohol in the last month.

Cowley County celebrated a further decline in an already small percentage of low-birth-weight babies. In addition, the young people of Cowley County sought post-high-school education or training at a higher rate this year. Concern does exist for the increase in the percentage of births to mothers who lacked a high school diploma, a rate well above the state average. An additional negative increase was the percentage of Cowley County births that occurred to single teenage mothers.

Crawford County experienced a reduction in the percentage of children who were placed outside the home. Other good news included dramatic increases in childhood immunizations along with the improvement in the percentage of births with early prenatal care. On the negative side, reports of child abuse and neglect increased this year as did the percentage of births to single teenage mothers.

DECATUR had plenty of good news, particularly in the educational area. The graduation rate remained among the best in the state, as did the percentage of children participating in post-high-school education or training, which increased this year. Opportunities for improvement exist. The percentage of children who were immunized by age two improved but still remained below the statewide level.

Dickinson County boasts positive results in early childhood education. This county had a sharp jump in the rate of Head Start participation. There was also improvement in the availability of child care. Some concern was noted, particularly with an increase in juvenile court filings. The rate of post-high-school education and training declined some this year and remained below the state level.

Doniphan County enjoyed an increase in Head Start availability for its children. In addition, the rate of reported child abuse and neglect was down and was one of the lowest in Kansas. This county did have a high rate of children in poverty relative to most other counties. A further concern was the decline in the rate of post-secondary education and training.

Douglas County had good news in some areas of children's health. The percentage of births that included early prenatal care increased further this year and was about equal to the state rate. Childhood immunizations posted similar findings. However, the percent of low-birth-weight babies had a rather substantial increase this year. An additional concern was the percentage of high school graduates who sought additional education or training, a rate that declined this year.

County Seat: Kinsley

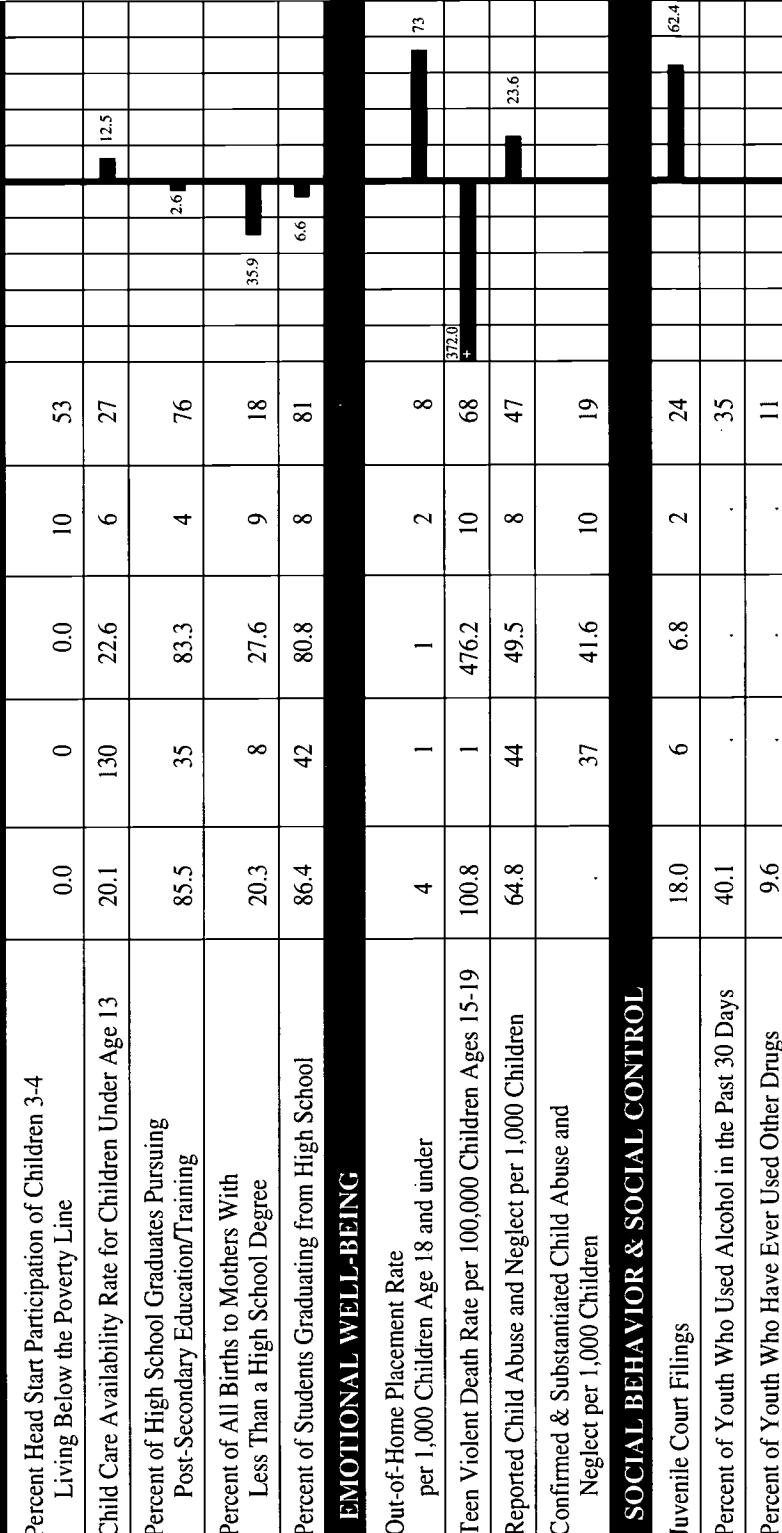

Edwards County made great strides in the full immunization of its children, attaining a rate among the top third in Kansas. There were areas in need of further attention, too. The percentage of births to mothers who lacked high school degrees, already high in the base years, increased further. Edwards County continued to lack a Head Start program for its eligible children.

Elk County should take pride in the rate with which its young people completed high school. A substantial improvement occurred this year. The improvement in childhood immunization rate this year was another cause for celebration. Concern existed with the low rate of child care availability. In addition, close to one-in-four Elk County children lived in poverty.

ELLSWORTH

Ellsworth County enjoyed improvement in the percentage of births that included early prenatal care, an important contributor to childhood outcomes. Early childhood immunizations also increased as well; this year's rate was among the top twenty percent statewide. There were troubling areas as well. The rate of juvenile court filings increased and was well above the state rate. The percentage of low-birth-weight babies also took a turn for the worse this year.

Finney County experienced an increase in the number of eligible children participating in Head Start. Additional good news were the reduction in mortality rates for children and in the rate of violent deaths for teenagers. Concerns exist as well. The rate of out-of-home placement has increased. In addition, the high school graduation rate declined further and was among the lowest in Kansas, clearly a troubling finding.

Franklin County children benefited from efforts made to obtain a large increase in the childhood immunization rate. The rate of births to children with early prenatal care also increased and was above the state rate this year. Concerns for Franklin County included a rate of post-secondary education and training in the bottom 20 percent statewide and an increased rate of reported child abuse and neglect.

County Seat: Junction City		

Geary County experienced a slight reduction in the percentage of births to mothers without a high school diploma, maintaining a rate below the statewide level. More good news is that the percentage of children fully immunized by age two improved this year. There were concerns for children as well. A high percentage of Geary County children resided in poverty. In addition, despite a slight increase this year, the graduation rate was among the bottom ten percent in Kansas.

County Seat: Gove		

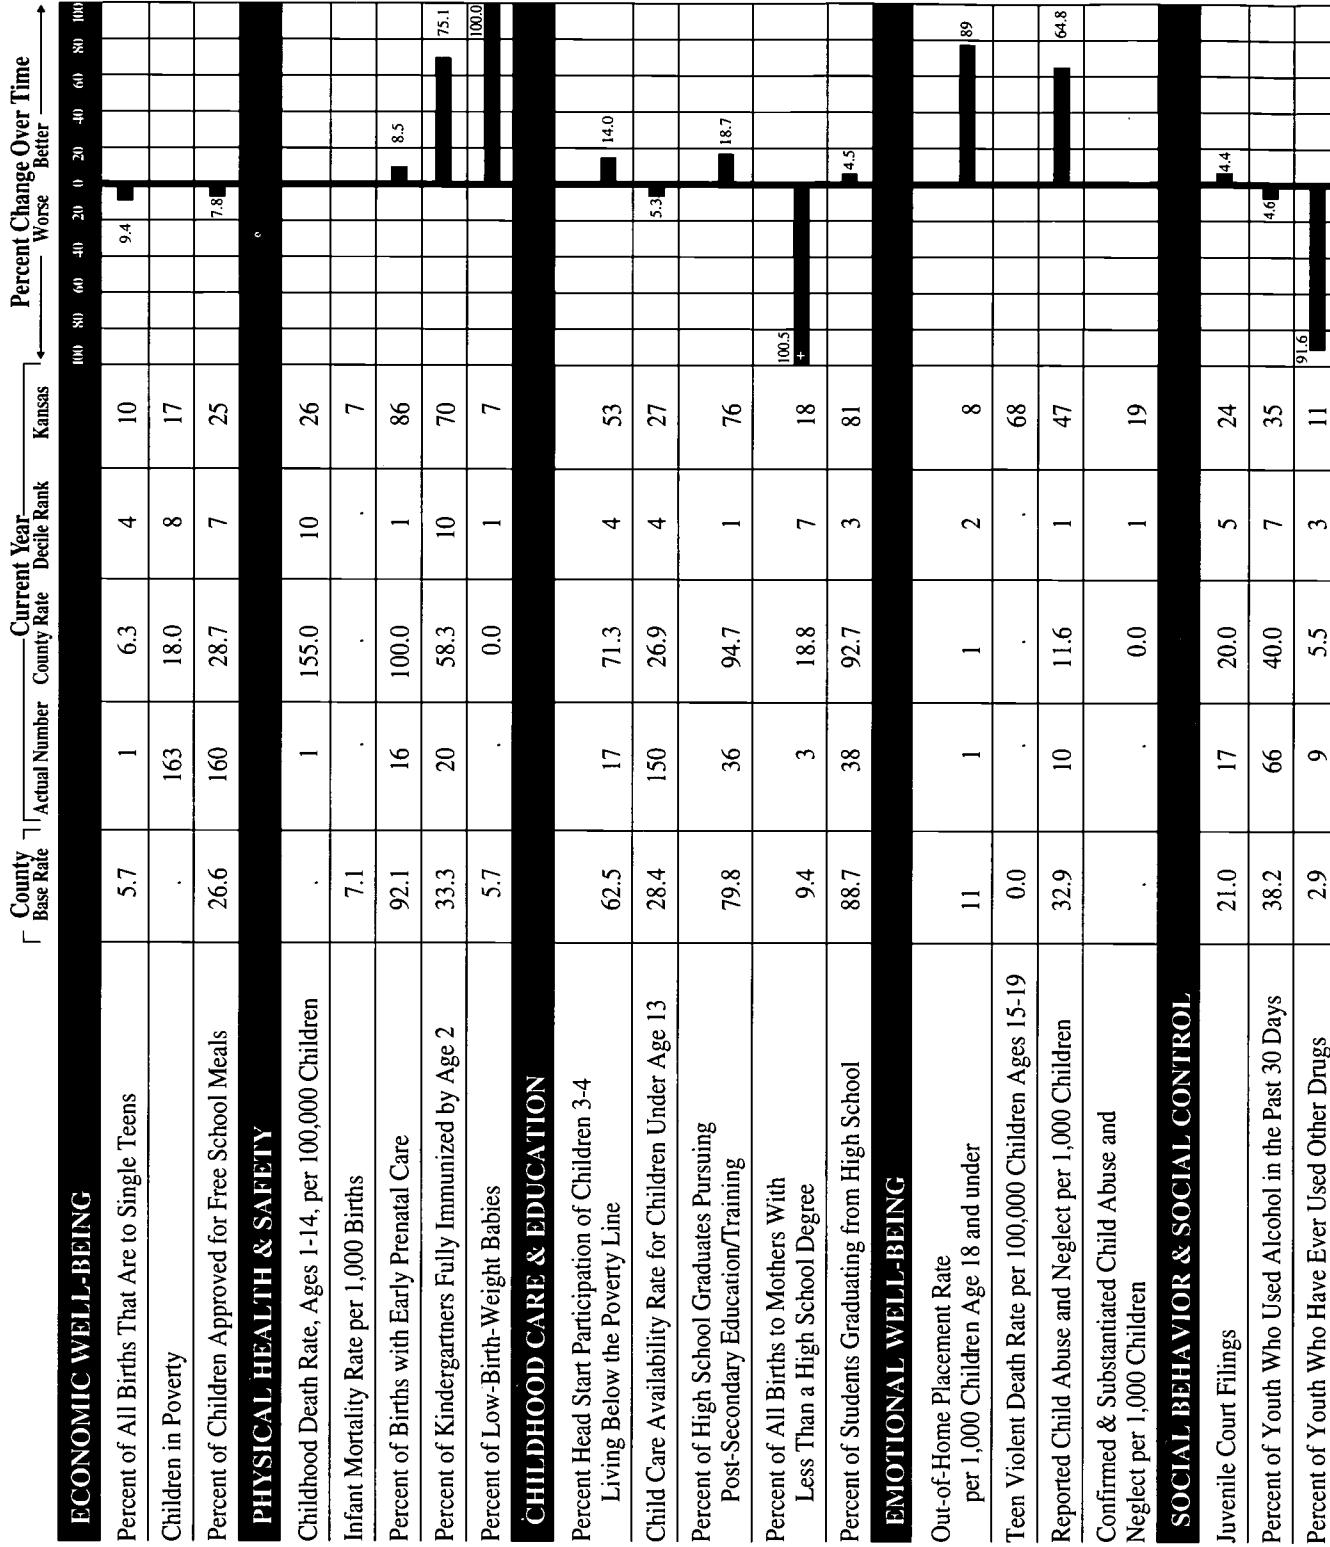

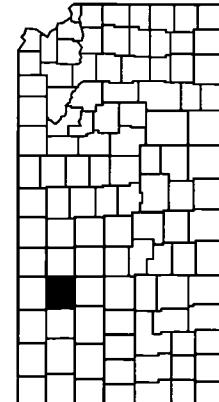

Gove County boasted positive educational outcomes. The high school graduation rate was among the highest in Kansas. A high percentage of graduates pursued post-secondary education. Among the additional good news is that less than one in ten Gove County children lived in poverty. Potential concerns existed, including a reduction this year in the percentage of births with early prenatal care and a drop in child care availability.

County Seat: Hill City		

Graham County produced very positive educational outcomes this year. High school graduation rates increased to well above the state average. The percentage of students seeking post-high-school education or training was in the top ten percent statewide. Despite this good news, there were areas of concern. These included a childhood immunization rate in the bottom ten percent statewide, despite a large increase this year. In addition, a relatively high percentage of Graham County youth indicated they had used alcohol in the past month.

Grant County displayed progress in immunizations and prenatal care. While room for improvement remained, the immunization rate increased substantially this year. The same can be said for the percentage of births with early prenatal care, which showed a change for the better. There was concern for the percentage of births to unmarried teenagers. This figure increased compared to the base years and was among the bottom ten percent statewide.

Demographic	Greenwood County	Kansas

Greenwood County residents should be quite pleased with the progress identified in this year's childhood immunization rate, an area showing substantial improvement. Another high point for this county was the lower percentage of births to mothers with no high school degree. Troubling areas included an increase in the rate of juvenile court filings. Additionally, one-in-five children in this county live in poverty.

Hamilton County children graduated high school at a rate equal to the top ten percent of all counties. A high percentage of high school graduates in Hamilton County seek additional training or education. This high base-year rate was maintained in the current year. Despite the positive educational outcomes, a notable concern exists in the percentage of births to mothers who had no high school degree. This rate increased substantially this year and was among the bottom ten percent statewide.

Harper County citizens should be pleased with the high level of prenatal care among expectant mothers. The rate of early care increased this year, surpassing the statewide average. More good news, is that the immunization rate made a large jump this year. Some concern exists in the educational area. The percentage of births that were to mothers who lacked a high school degree increased substantially this year. This performance ranks in the bottom 20 percent in Kansas.

County Seat: Newton

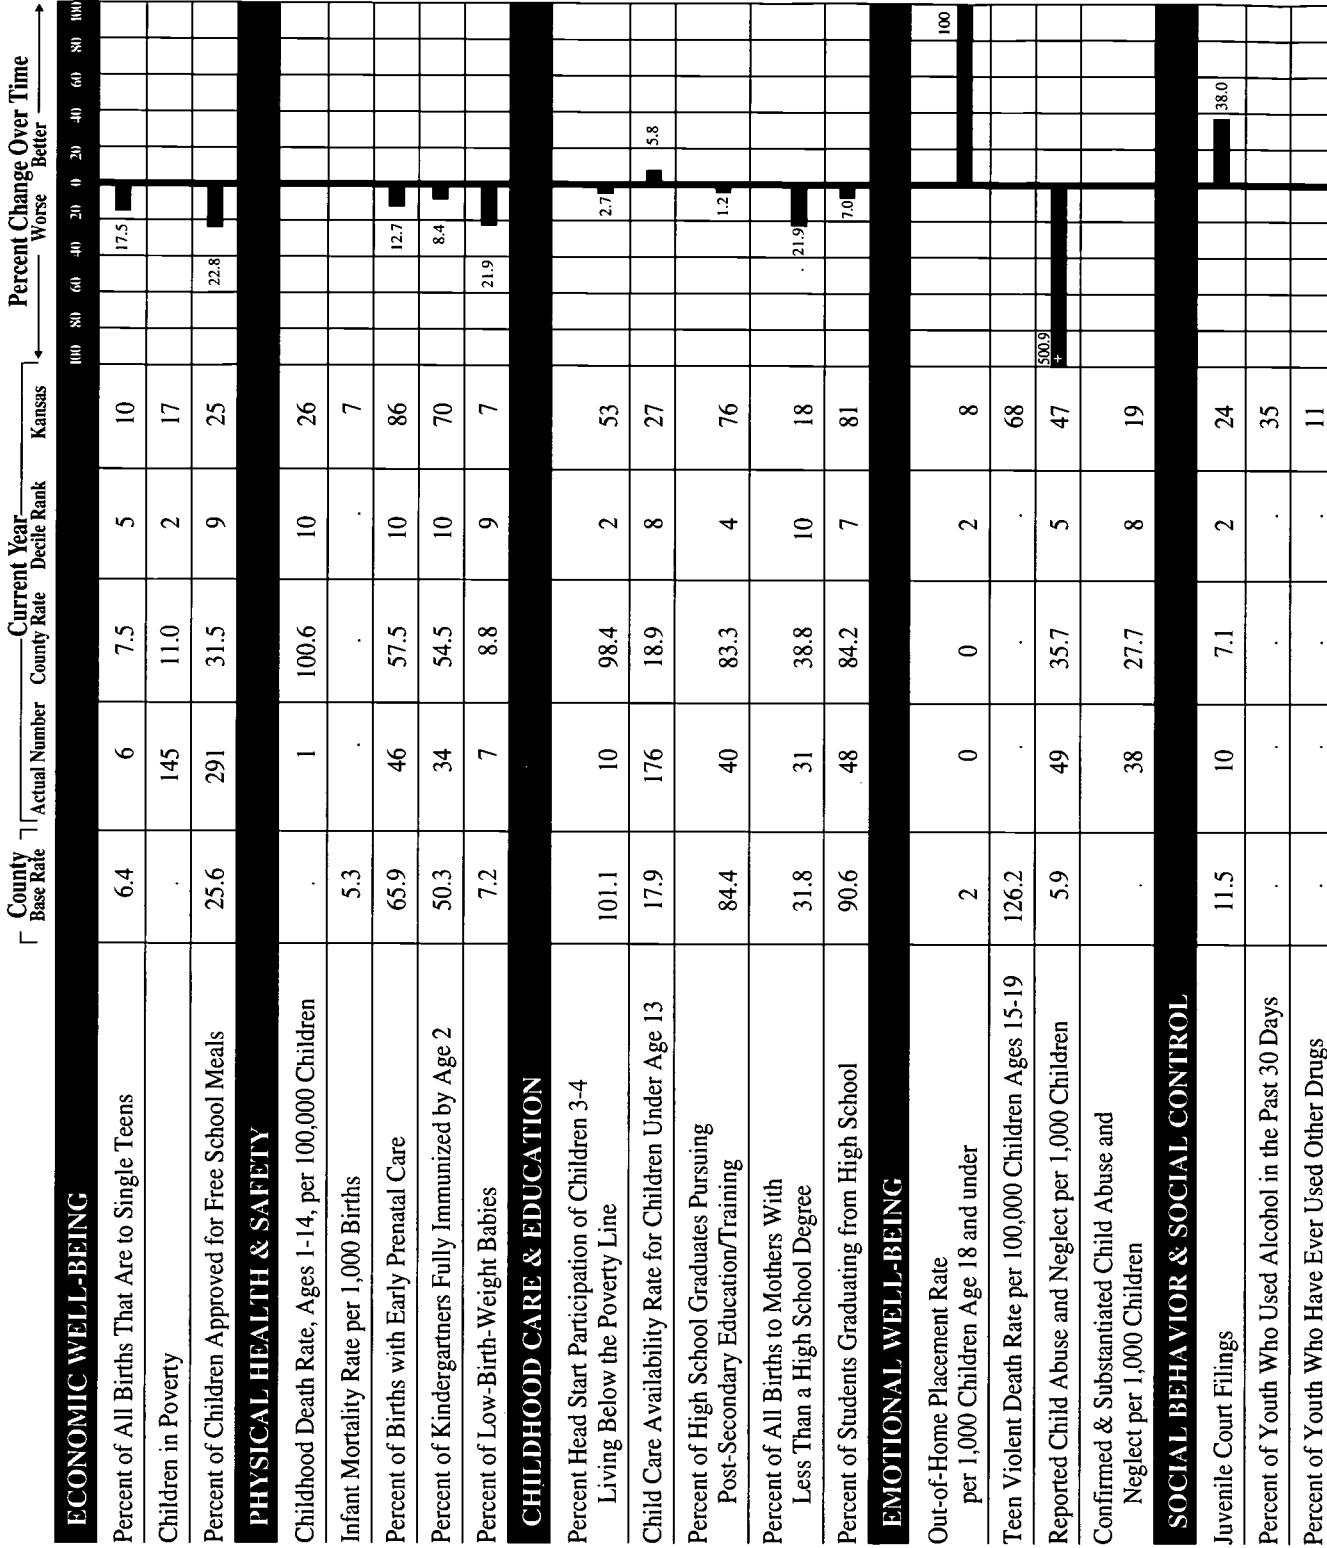

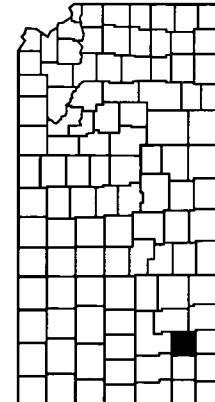

Harvey County attained further improvement in an already high rate of births with early prenatal care. In addition, this county saw close to a 20-percent increase in early childhood immunizations. Both results increase the likelihood of raising healthy children. Sadly, the rate of violent deaths of Harvey County teens increased this year. In addition, the juvenile court filings were up.

County Seat: Jetmore		

Hodgeman County obtained large improvement in the percentage of fully immunized children. Additional good news included a high school graduation rate that was among the best in Kansas, well above the state average. The poverty rate for children was relatively low; just over one-in-ten children lived in poverty. While still above the state average, also noted was a decline in the rate of post-secondary education or training.

County Seat:	Holtton	

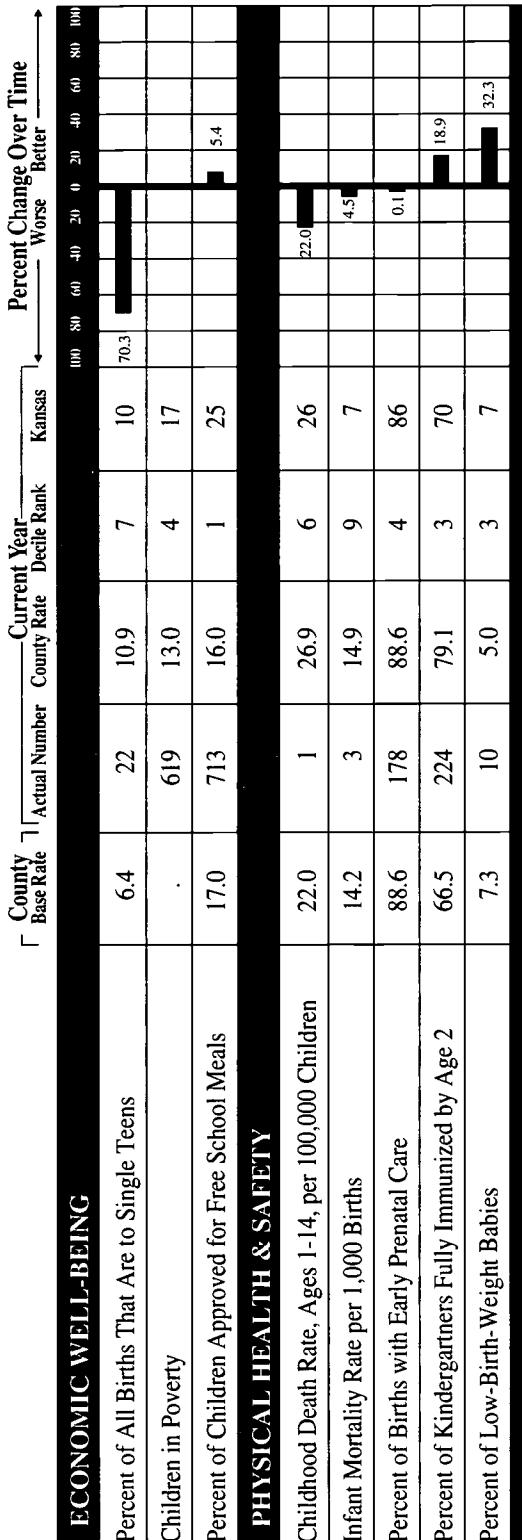

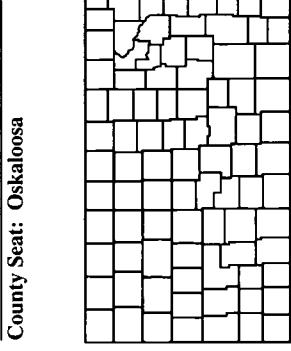

Jackson County students improved their rate of high school graduation slightly from the base years. This performance continued to be above the state average. Immunization rates for this year represented more good news with rates well above the state rate and among the top 20 percent in Kansas. There were concerns, however. Youth in Jackson County had rather low rates of participation in post-secondary education or training. Reports of child abuse and neglect increased as well.

Unemployment	4.9%	3.8%	

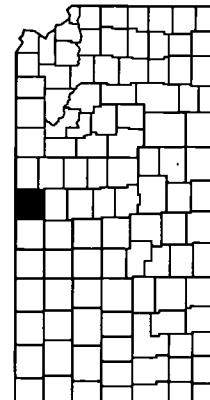

Jefferson County continued to post good results for births with early prenatal care. This county also experienced a decline in percentage of low-birth-weight babies, achieving a rate in the top 30 percent statewide. While the rate of post-secondary education and training improved somewhat this year, the rate was still below the state average. A high percentage of Jefferson County youth reported having used alcohol in the month prior to being surveyed.

(1997 data provided by Kansas Dept. of Human Resources, Labor Market Information Services)		
County Seat: Mankato		

Jewell County made great strides in childhood immunizations. Rates improved from the base year and were in the top ten percent statewide this year. High school graduation rates, among the highest in Kansas, were another cause for celebration in Jewell County. A high percentage of graduates in this county sought additional education or training. The availability of child care was a potential concern; despite a slight improvement this year, the rate lagged well behind the state average.

Kearny

Kearny County achieved improvement in the rate of Head Start participation for eligible children. In addition, this county's rate of early childhood immunizations improved to a rate above the state average. There were also areas of concern for this county. The percentage of births with early prenatal care remained stable, at a rate well below the state average. Child care availability declined while births to mothers who have no high school degree increased.

County Seat: Kingman		

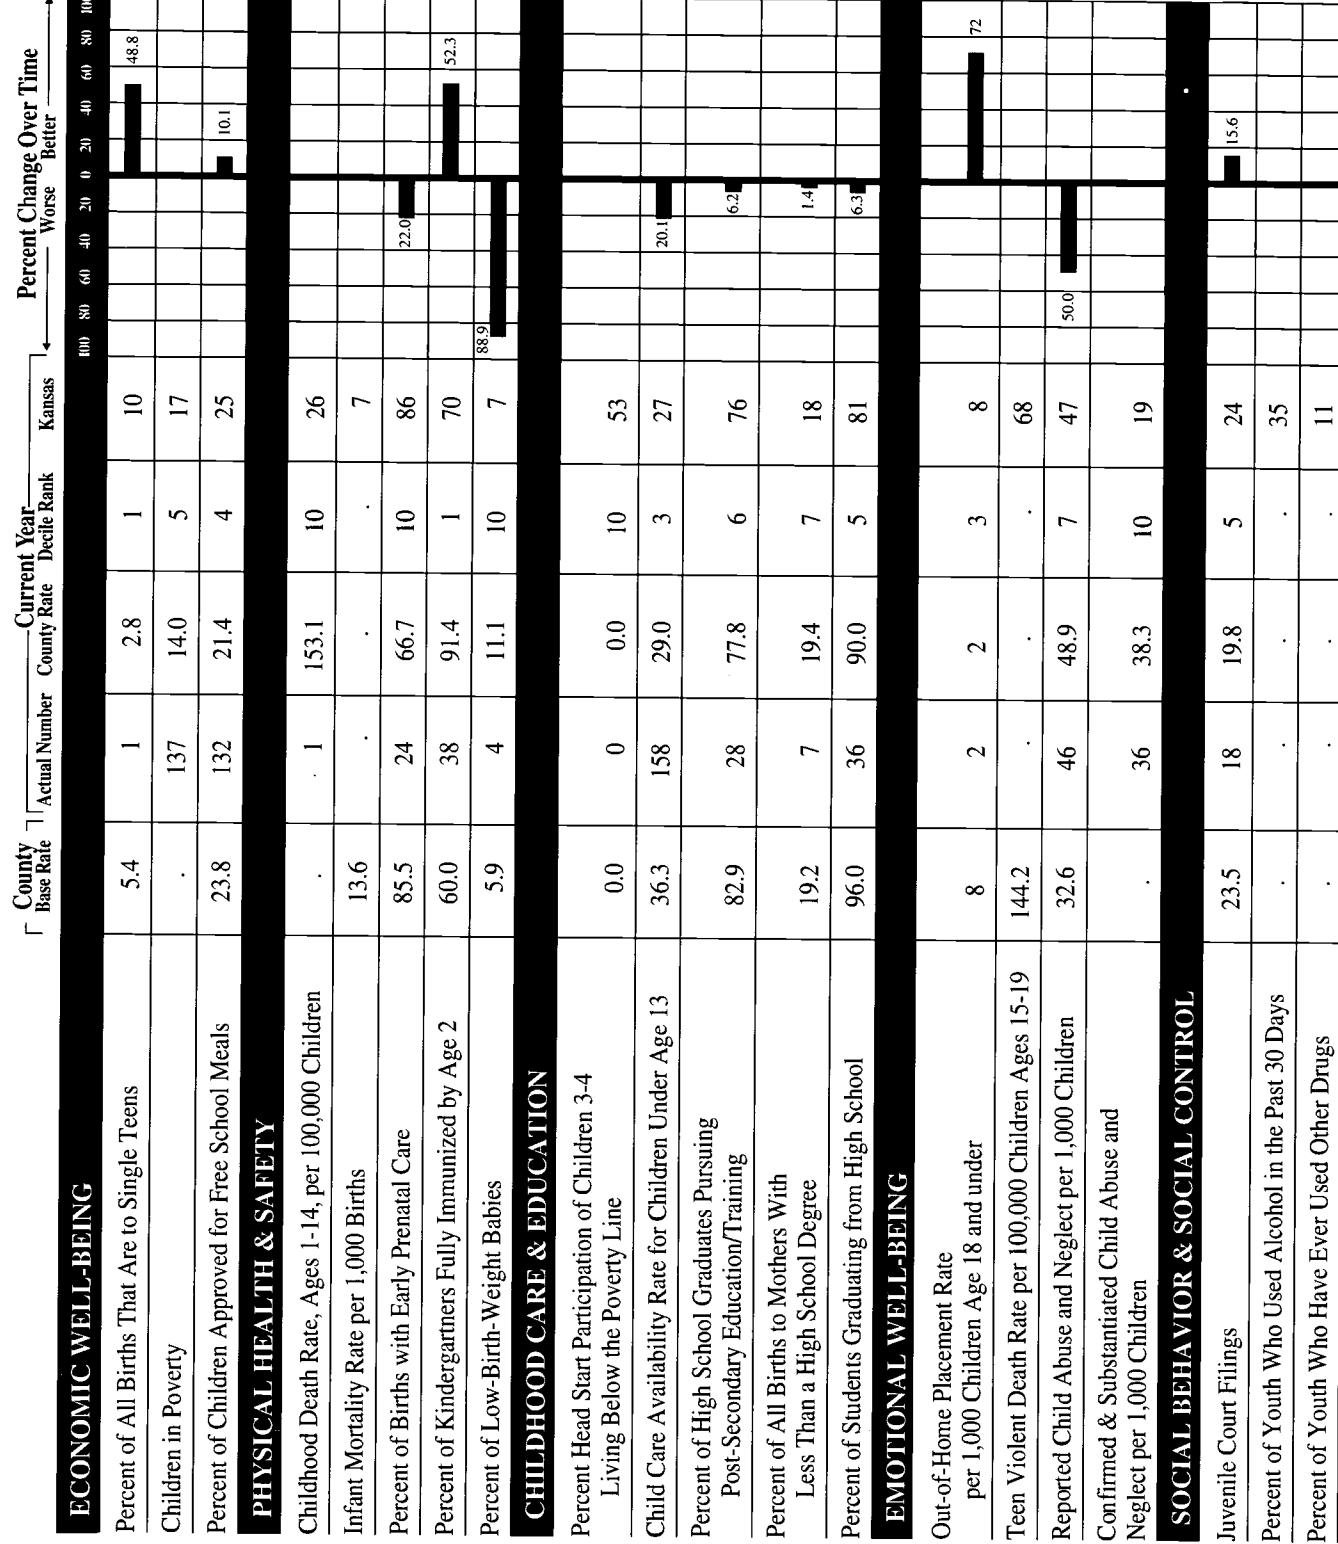

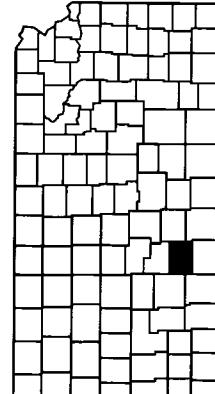

Kingman County high school graduates pursued further education or training at a higher rate this year than the base years. This year's rate was in the top 20 percent statewide. More good news this year is that Head Start became available in Kingman County. Troubling areas included an increase in the rate of juvenile court filings and an increase in the rate of child abuse and neglect for Kingman County.

County Seat: Greensburg	

Kiowa County posted a dramatic improvement in early childhood immunizations this year. In addition, more than nine out of ten kindergartners were fully immunized by age two. The high school graduation rate in this county remained above the state average. Kiowa County did experience a slight decline in rate of post-secondary education or training, although this rate still remained high.

County Seat: Oswego

Labelle County experienced a positive decline in the rate of children who resided in out-of-home placements. The percentage of low-birth-weight babies declined further and was in the top 20 percent of all counties. **Lambette County** also experienced substantial improvement in early childhood immunizations, although this year's rate lagged behind the statewide level. As an additional concern, a high percentage of young people reported recent use of alcohol.

Leavenworth County enjoyed a reduction in all three mortality indicators, infant and child death and violent deaths for teens. Certainly that was great news. Early childhood immunization rates increased slightly this year and exceeded the state average. The percentage of births to mothers without high school degrees held steady compared to base years and was also below the state rate. Issues for attention and concern in this county included an increase in reports of child abuse and neglect and a child care availability that ranks in the bottom 20 percent statewide.

Unemployment (1997 data provided by Kansas Dept. of Human Resources, Labor Market Information Services)	3.1%	3.8%
County Seat: Lincoln		

Lincoln County youth enjoyed much success in educational ventures. Despite a slight drop in graduation rates, this county continued to be well above the state average. The percentage of graduates who continue on to obtain post-secondary education or training improved as well. On the negative side, Lincoln County experienced this year a reduction in the percentage of births that included early prenatal care. A further concern was an increase in the rate of child abuse and neglect reports.

County Seat: Mound City		

Linn County students continued to graduate from high school at a rate well above the state average. This county also saw a slight improvement in the rate of births with early prenatal care. The rate of early childhood immunizations increased dramatically from the base years, although it remained below the state average. Other areas of concern included the availability of child care, among the lowest in the state, and a rate of post-secondary education and training below the state average.

Unemployment (1997 data provided by Kansas Dept. of Human Resources, Labor Market Information Services)	2.6%	3.8%
County Seat: Oakley		

Logan County residents had much to celebrate with this report. Early childhood immunizations made a large jump compared to base years, landing well above the state rate this year. Educational good news abounds. High school graduation rates declined slightly but remained quite high, and the rate of post-secondary education and training was among the best in Kansas. The rate of Head Start participation among eligible children was also high. Logan County should be concerned about a sharp increase in the rate of childhood abuse and neglect reports.

County Seat: Emporia		

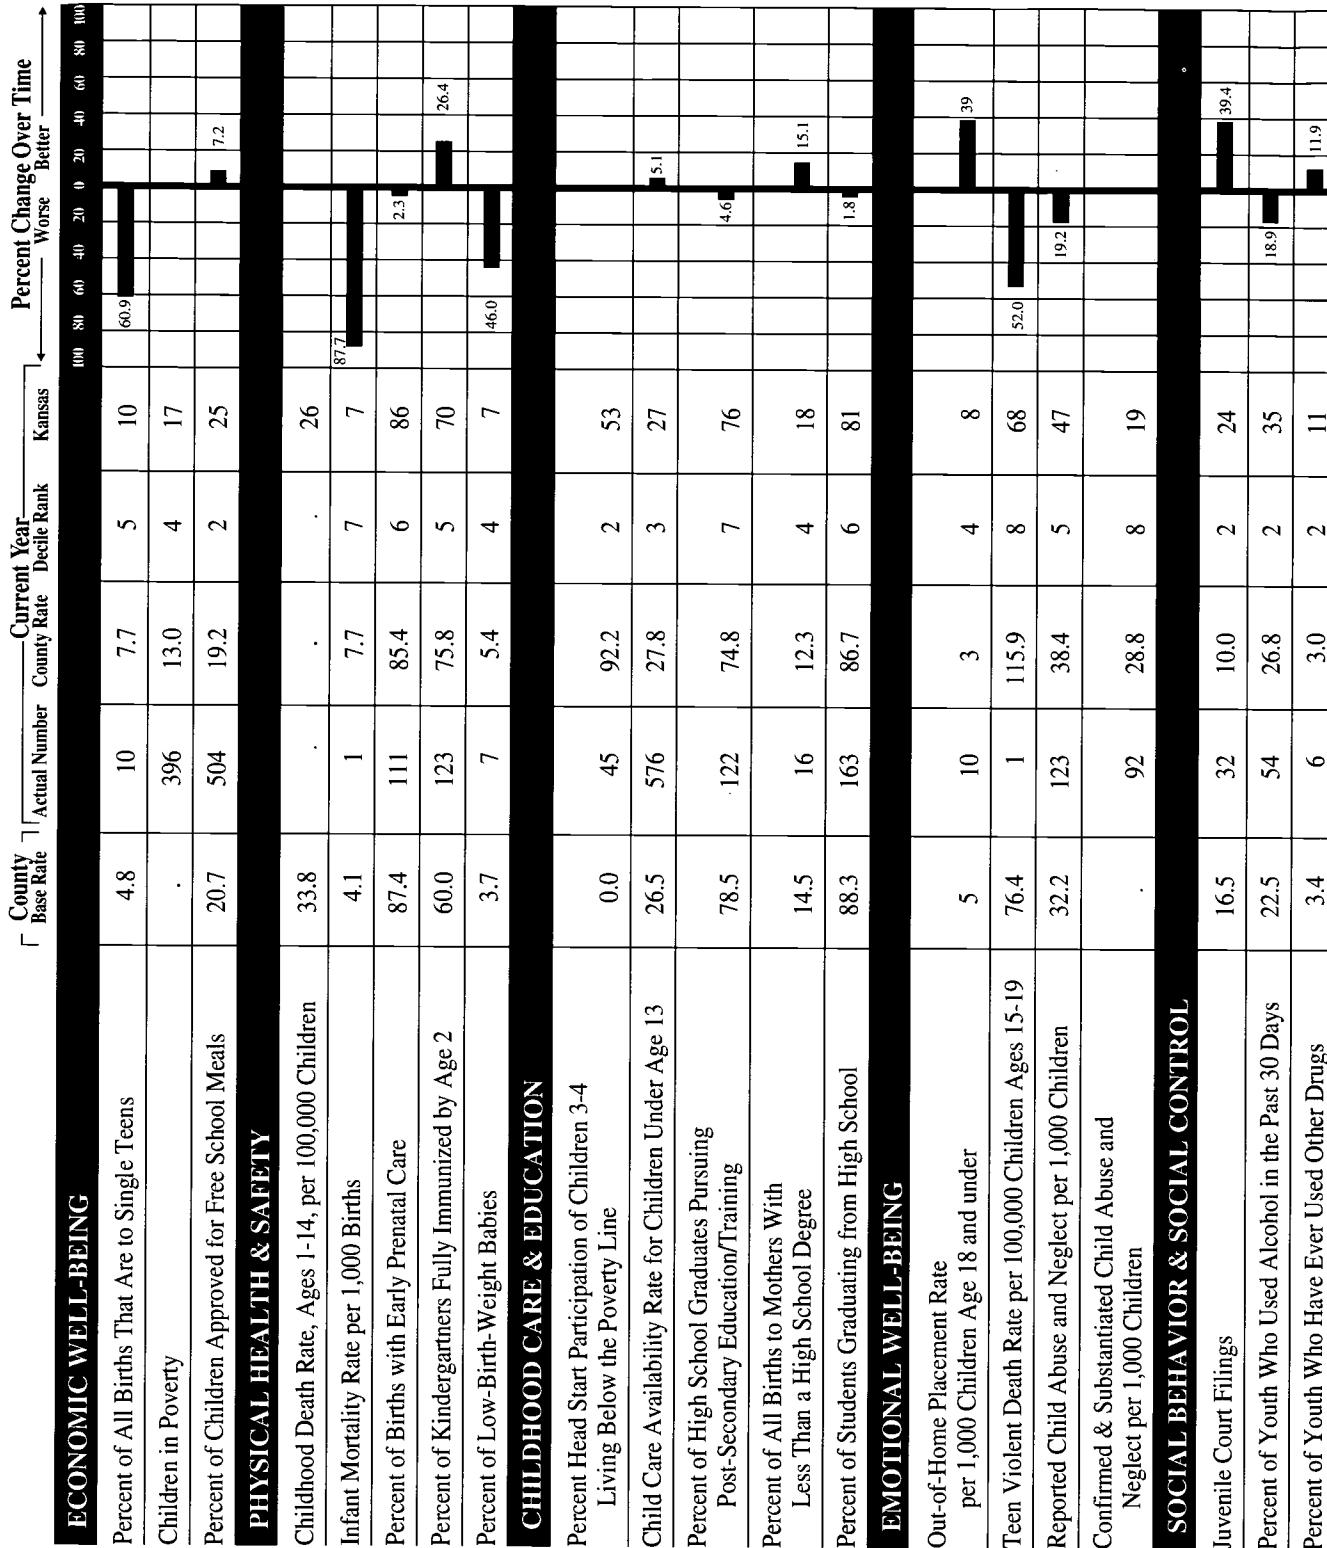

Lyon County posted substantial improvement this year in the rate of early childhood immunizations. This year's rate was in the top 20 percent of all counties. Further progress was found in the percentage of early births with prenatal care, which increased from the base years, although it remained slightly below the state rate. Concerns for Lyon County included an increase in the rate of juvenile court filings to a rate well above the state average. The percentage of births to mothers with no high school degree increased also.

County Seat: Marion		

Marion County showed significant improvement in the number of juvenile court filings and youth who have ever used drugs. A decline is also seen in the percent of all births to mothers with less than a high school degree. The county's efforts toward increased immunizations is reflected in this year's rate, which now exceeds the state average. Of concern, this year there were 54 youth who used alcohol in the past 30 days, compared to 27 youth last year. The gradual decline over the past few years in the percentage of births with early prenatal care warrants attention.

County Seat: McPherson		

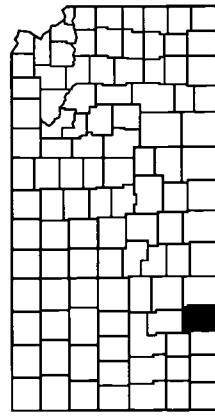

McPherson County saw an increase in the percent of births with early prenatal care. The unemployment rate dropped, and a greater percentage of eligible three- and four-year-olds participated in the local Head Start program. Of concern was the 66 births to mothers without a high school degree this year, compared to 52 last year. Dramatic, increased rates in all areas of social behavior and control also demand attention.

County Seat: Meade

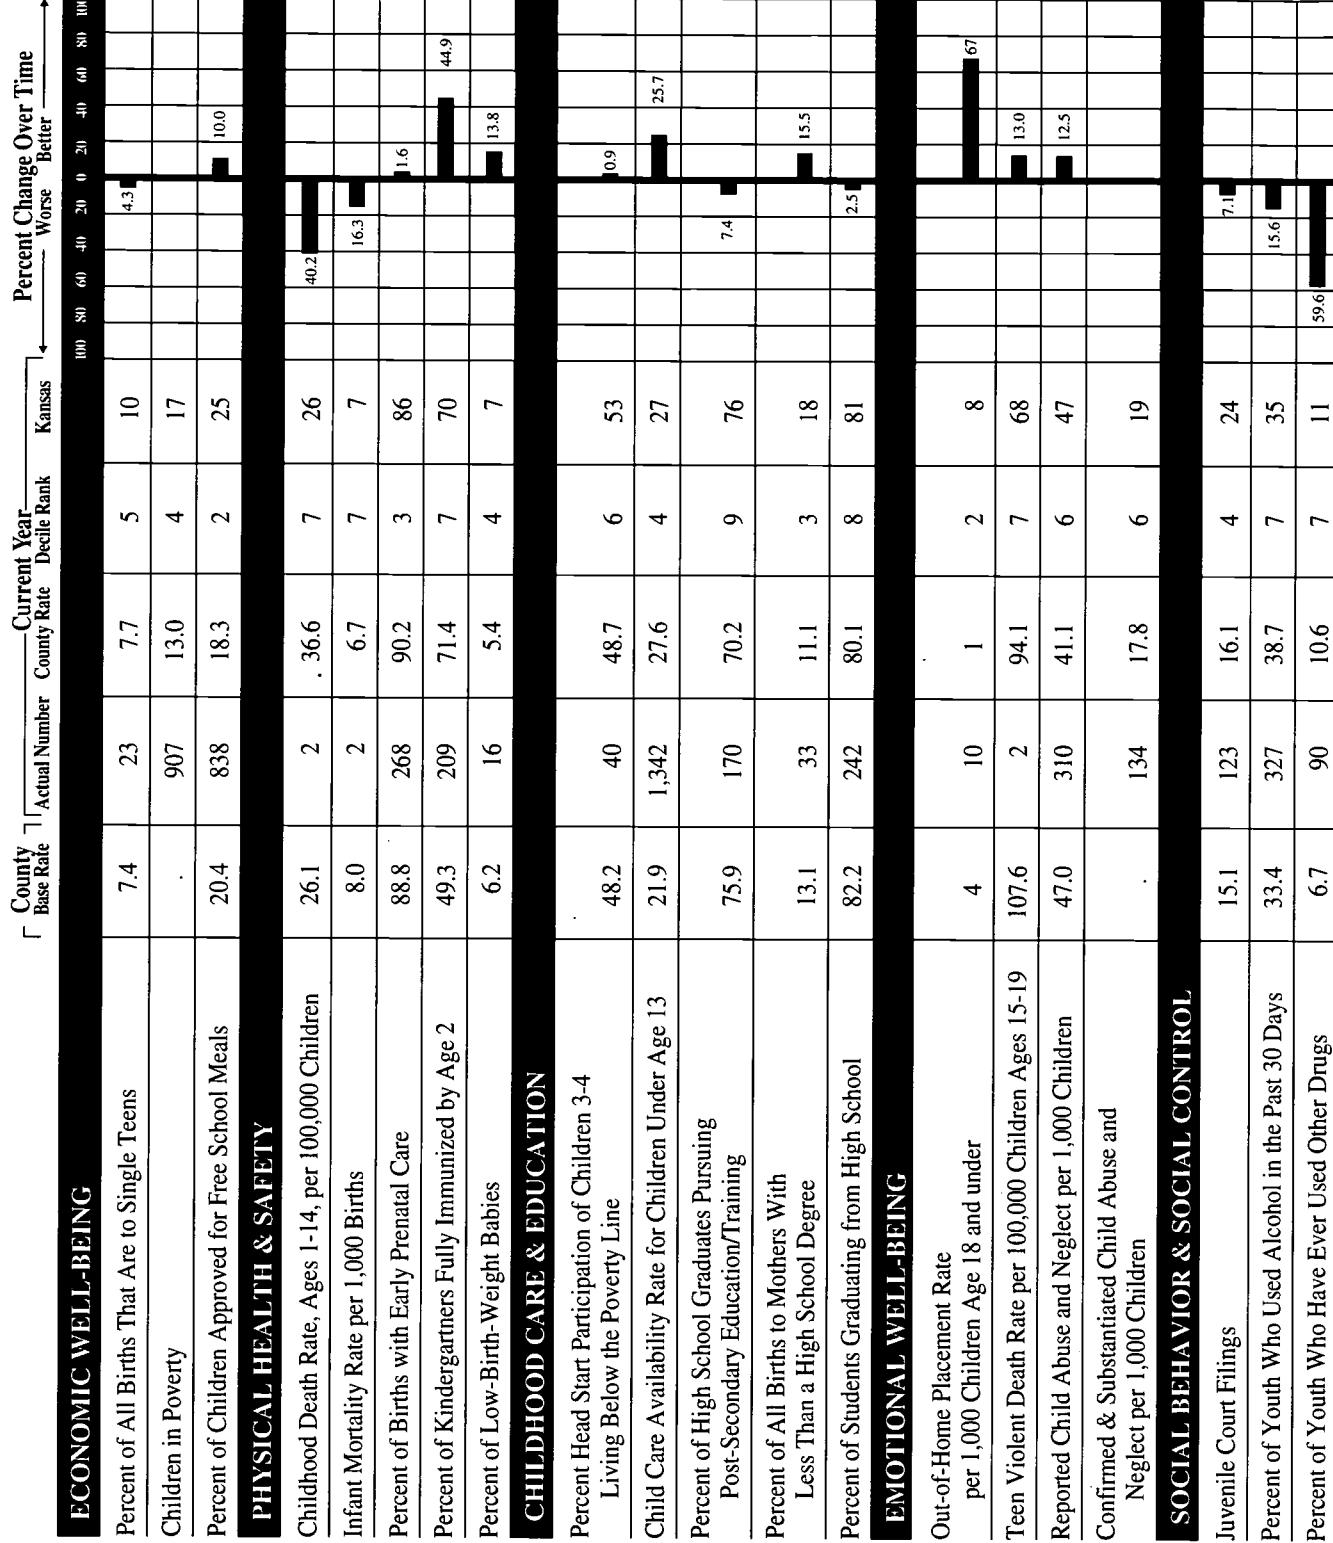

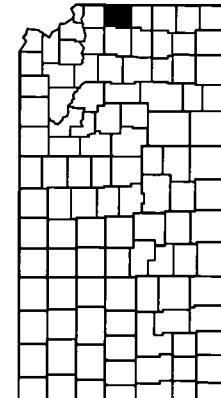

Meade County continued to show annual improvement in the percentage of kindergartners who are fully immunized by the age of two. The county celebrated its high school graduation rate of over 94 percent, which far exceeds the state average. While the percent of births to mothers without a high school degree declined, there was an increase in the percent of births to single teens. The decline in percent of births with early prenatal care places Meade County in the lowest ten percent for the state. The county is also ranked in the state's worst ten percent for juvenile court filings.

Unemployment (1997 data provided by Kansas Dept. of Human Resources, Labor Market Information Services)	3.9%	3.8%
County Seat: Paola		

Miami County celebrated another year of significant increase in the percentage of kindergartners fully immunized by age two. The county's rate now exceeds the state average. There was a notable rise in child care availability. Compared to last year, there were half as many youth who reported ever using other drugs. The increase in juvenile court filings and percent of youth who used alcohol in the past 30 days deserves some attention.

	County	State	Population Size	7,203	2,477,574

Mitchell County showed significant improvement in the percentage of kindergartners fully immunized by age two and the rate of child care availability. Other good news is the percent of students graduating from high school exceeded the state average. Of concern, the county has yet to implement a Head Start program for eligible children. A dramatic increase in the out-of-home placement rate is noted.

Median Family Income	\$27,063	\$32,966
Unemployment (1997 data provided by Kansas Dept. of Human Resources, Labor, Market Information Services)	5.2%	3.8%
County Seat: Independence		

Montgomery County celebrated a decline in the unemployment rate. The county did better than the state average in the percentage of births with prenatal care, the percentage of low-birth-weight babies, and the percentage of youth who used alcohol in the past 30 days. Dramatic improvement was seen in the percentage of kindergartners fully immunized by age two. With a 54.6 percent rate, however, the county remains at the bottom ten percent of the state. In addition, ways to encourage youth to complete their high school education should be explored. The high school graduation rate was 76 percent.

Morris County celebrated a decrease in the percentage of all births to mothers with less than a high school degree. The county also saw a decline in the percentage of all births to single teens. There was a greater percentage of high school graduates pursuing post-secondary education or training. While improvement can be seen in the decline of juvenile court filings, the percentage of youth who used alcohol in the past 30 days increased. Unfortunately, unemployment was up, and the county has yet to implement a Head Start program that would benefit eligible children.

MORTON

	County	State
Population Size	3,480	2,477,574
Percent Population Under Age 18	30.4%	26.7%
Ethnicity		
White	88.0%	88.4%
Black	0.0%	5.7%

Median Family Income	\$30,785	\$22,966
Unemployment	2.1%	3.8%
(1997 data provided by Kansas Dept. of Human Resources, Labor Market Information Services)		
County Seat:	Elkhart	

Morton County applauded a higher percentage of students graduating from high school. Increases in the percentage of births with early prenatal care and percentage of kindergartners fully immunized by age two indicated that a greater percentage of children are more likely to have a healthier childhood. Dramatic declines in the percentage of juvenile court filings and in the percentage of all births to mothers with less than a high school degree were also good news. The high percentage of children approved for free school meals may reveal the need for a Head Start program.

Nemaha County celebrated another year in the best ten percent of the state for percentage of births with prenatal care, percentage of all births to mothers with less than a high school degree, and percentage of youth who ever used other drugs. Improvement can be seen in all indicators for Early Childhood Care & Education and Social Behavior & Social Control. While Nemaha County did slightly better than the state average in the percentage of high school students pursuing post-secondary education or training, the county may want to explore ways to further improve in this area.

NEOSHO

County	State
Population Size	17,035 2,477,574

Median Family Income	\$27,613 \$32,966
Unemployment (1997 data provided by Kansas Dept. of Human Resources, Labor Market Information Services)	4.5% 3.8%
County Seat: Erie	

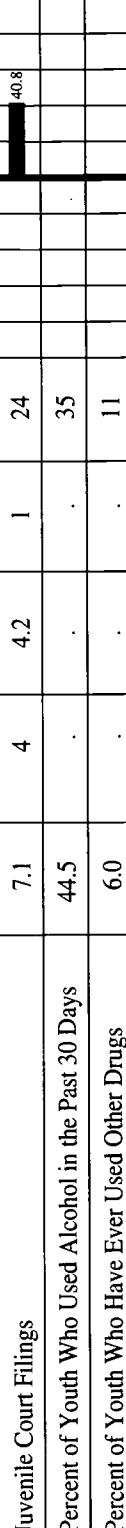

Neosho County showed further improvement in the percentage of births with early prenatal care, the percentage of kindergartners fully immunized by age two, the percentage of eligible children participating in Head Start, and the rate of child care availability. The decrease in percentage of juvenile court filings was also good news. Of serious concern were the increases in the percentage of all births to mothers with less than a high school degree and in the percentage of children living in poverty. Ways to correct the downward trend in the percentage of students graduating from high school and graduates pursuing secondary education or training may need exploring.

Ness County advanced to the best ten percent of the state for the percentage of high school graduates pursuing post-secondary education. Notable improvements can also be seen with the increase in the child care availability rate, the increase in the percentage of kindergartners fully immunized by age two, and the decline in the rate of juvenile court filings. The percentage of students graduating from high school far exceeded the state average. Reasons for the dramatic decline in the percentage of births with early prenatal care should be explored.

NORTON

Population Size	5,947	2,477,574

Unemployment	2.2%	3.8% <small>(1997 data provided by Kansas Dept. of Human Resources, Labor Market Information Services)</small>
County Seat: Norton		

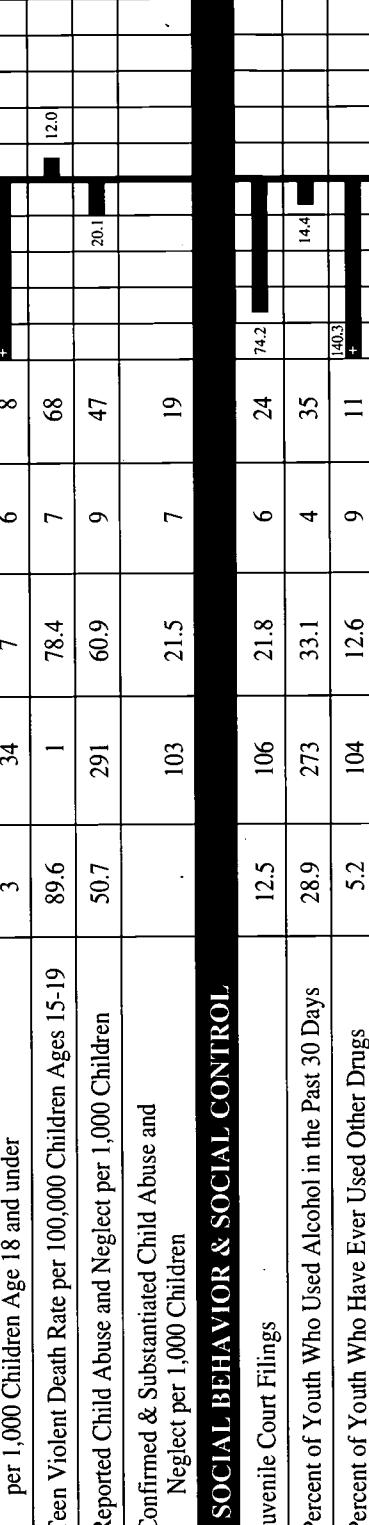

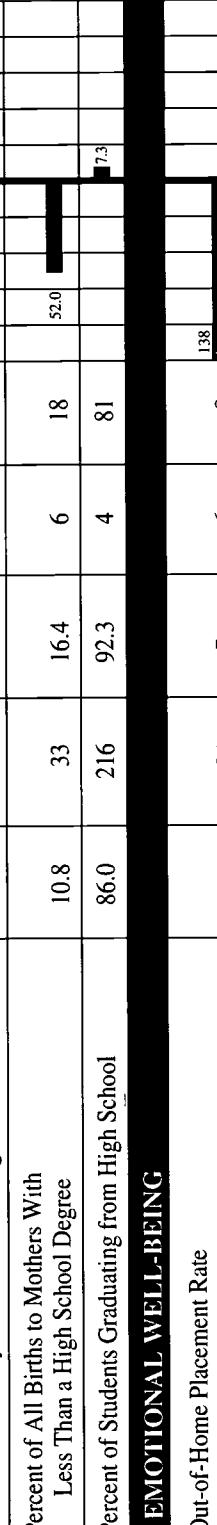

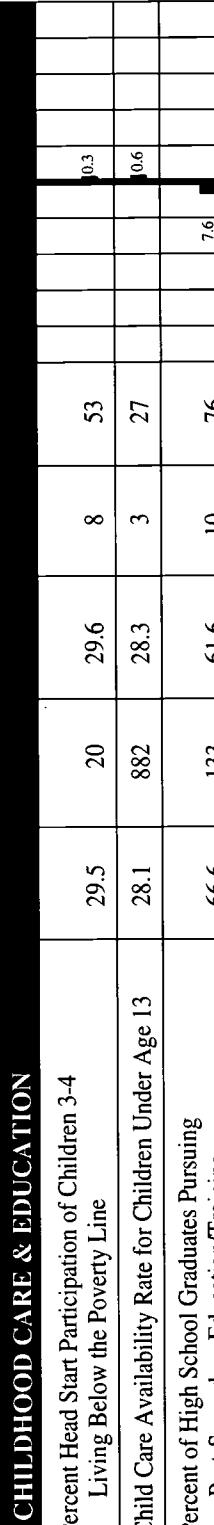

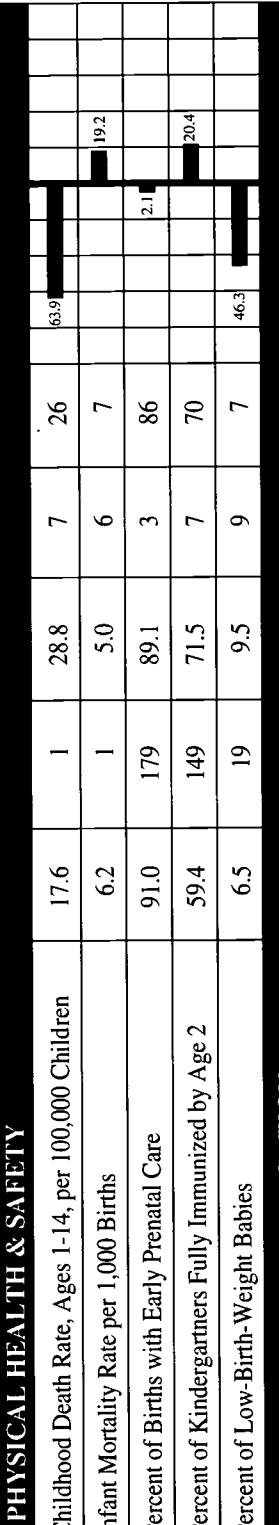

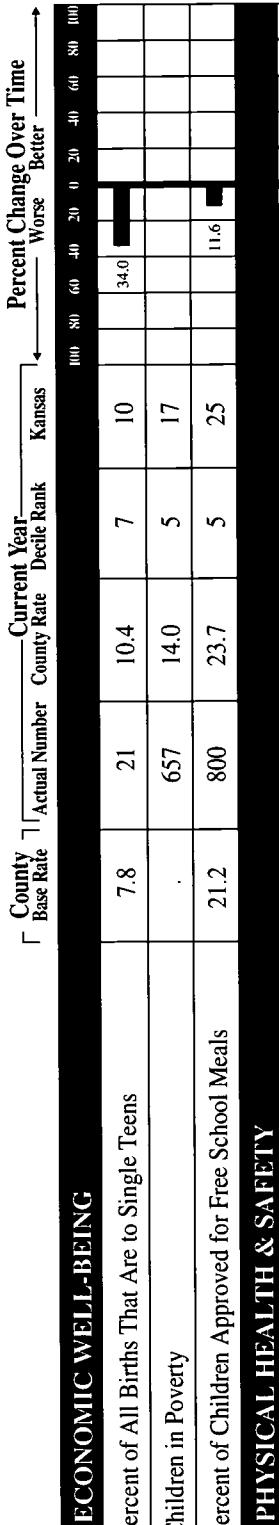

Norton County had much to celebrate. Significant improvement was seen in the percentage of births with early prenatal care, of all births to single teens, of kindergartners fully immunized by age two, of youth who ever used other drugs, and of high school graduates pursuing post-secondary education or training. The county is applauded for implementing a Head Start program this year. Of concern were the increase in the percentage of low-birth-weight babies and the increase in juvenile court filings.

(1997 data provided by Kansas Dept. of Human Resources, Labor Market Information Services)			
County Seat: Lyndon			

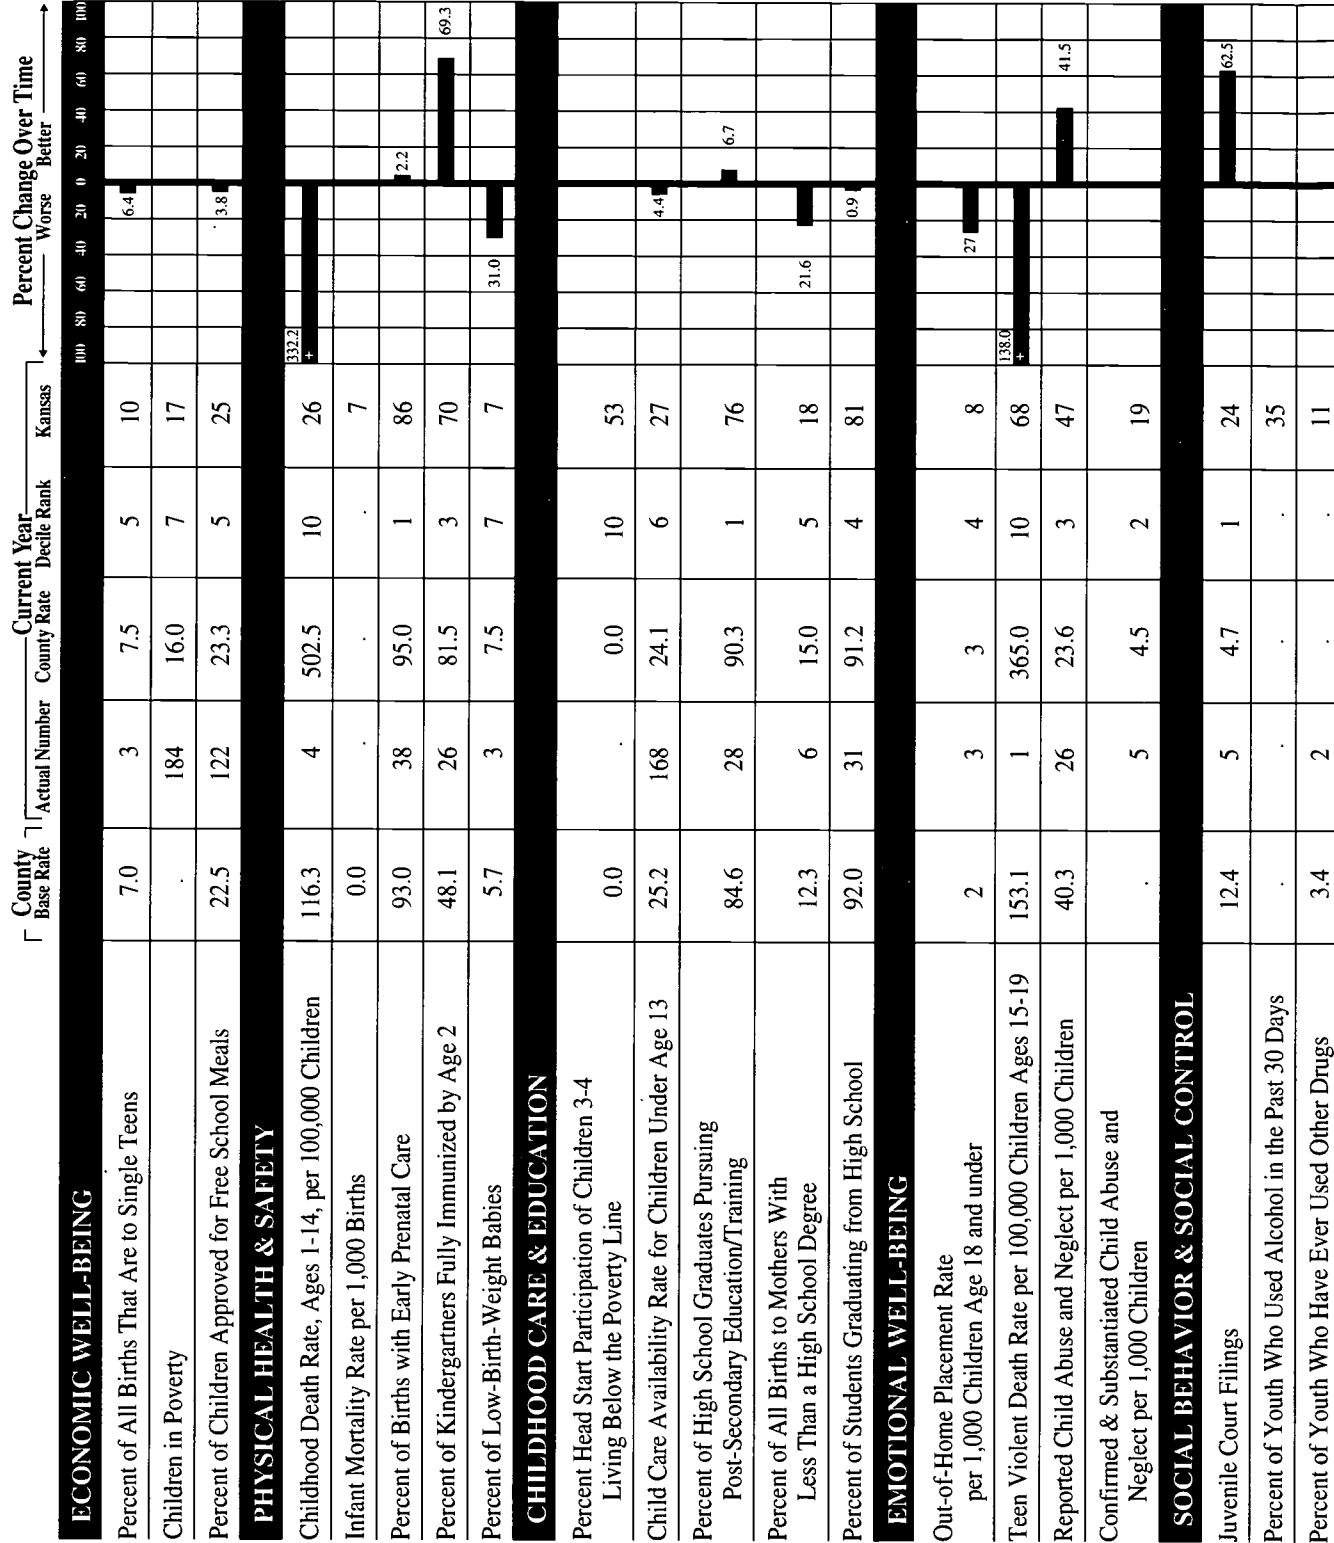

Osage County celebrated significant improvement in the percentage of kindergartners who are fully immunized by age two. The county did better than the state average in the percentage of births with early prenatal care and the percentage of students graduating from high school. Attention should be given to the dramatic increase in the percentage of all births to mothers with less than a high school degree and the percentage of low-birth-weight babies. Also of concern, there were increases in all areas of social behavior and social control, and there was a noticeable decline in the percentage of high school graduates pursuing post-secondary education or training.

OSBORNE

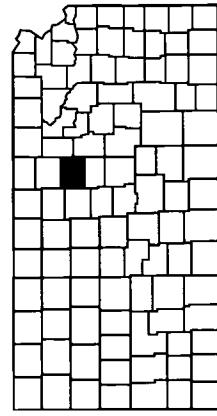

Population Size	4,867	2,477,574

County Seat: Osborne		

Osborne County achieved significant improvement in the percentage of kindergartners fully immunized by age two. The county ranked in the best ten percent of the state for its efforts with the following: percentage of births with early prenatal care, percentage of high school graduates pursuing post-secondary education or training, and percentage of juvenile court filings. Osborne County may want to further consider ways to improve the rate for child care availability and to implement a Head Start program for eligible children.

County Seat: Minneapolis		

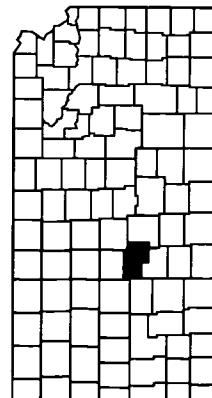

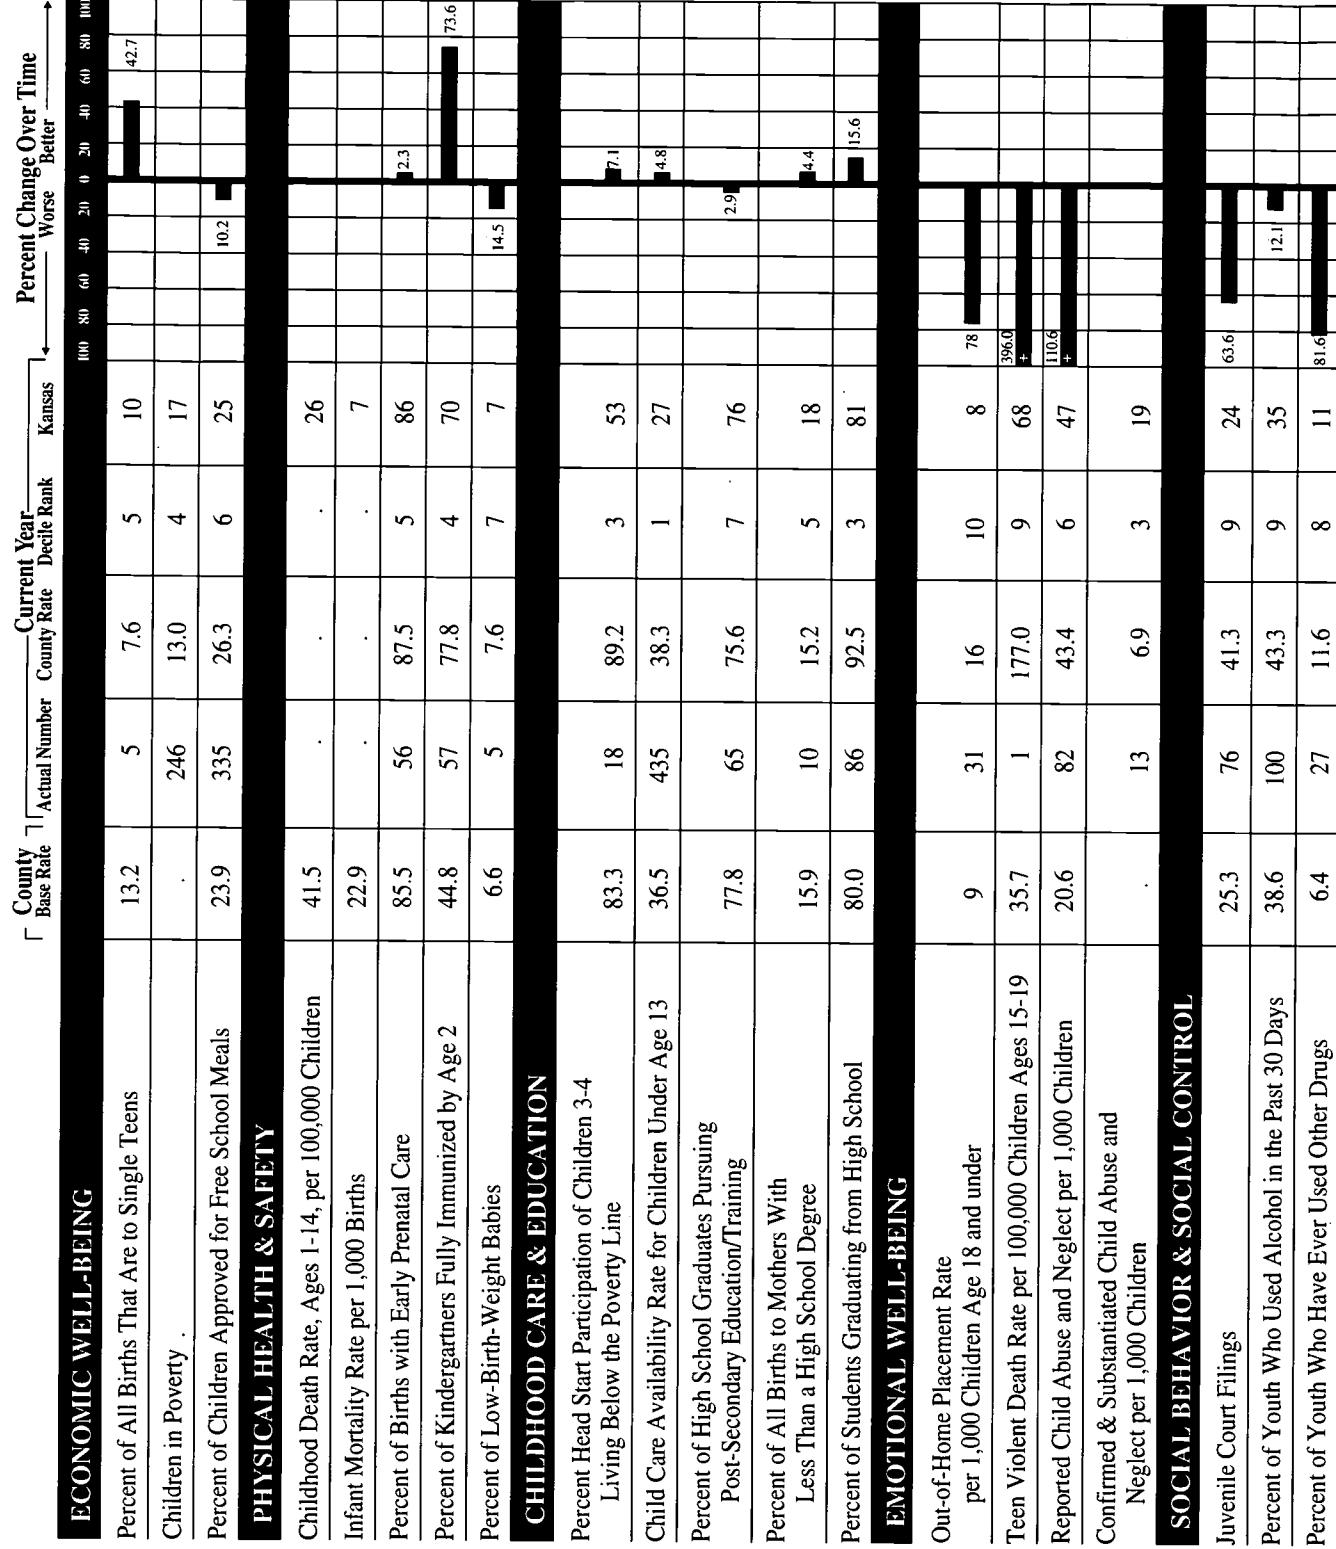

Ottawa County ranked in the best ten percent of the state for its high percentage of births with early prenatal care and high percentage of kindergartners fully immunized by age two. The significant decline in the percentage of all births to single teens was also good news. However, employment was up from the previous year. Ottawa County experienced a dramatic increase in placements and in the percentage of juvenile court filings.

County Seat: Phillipsburg

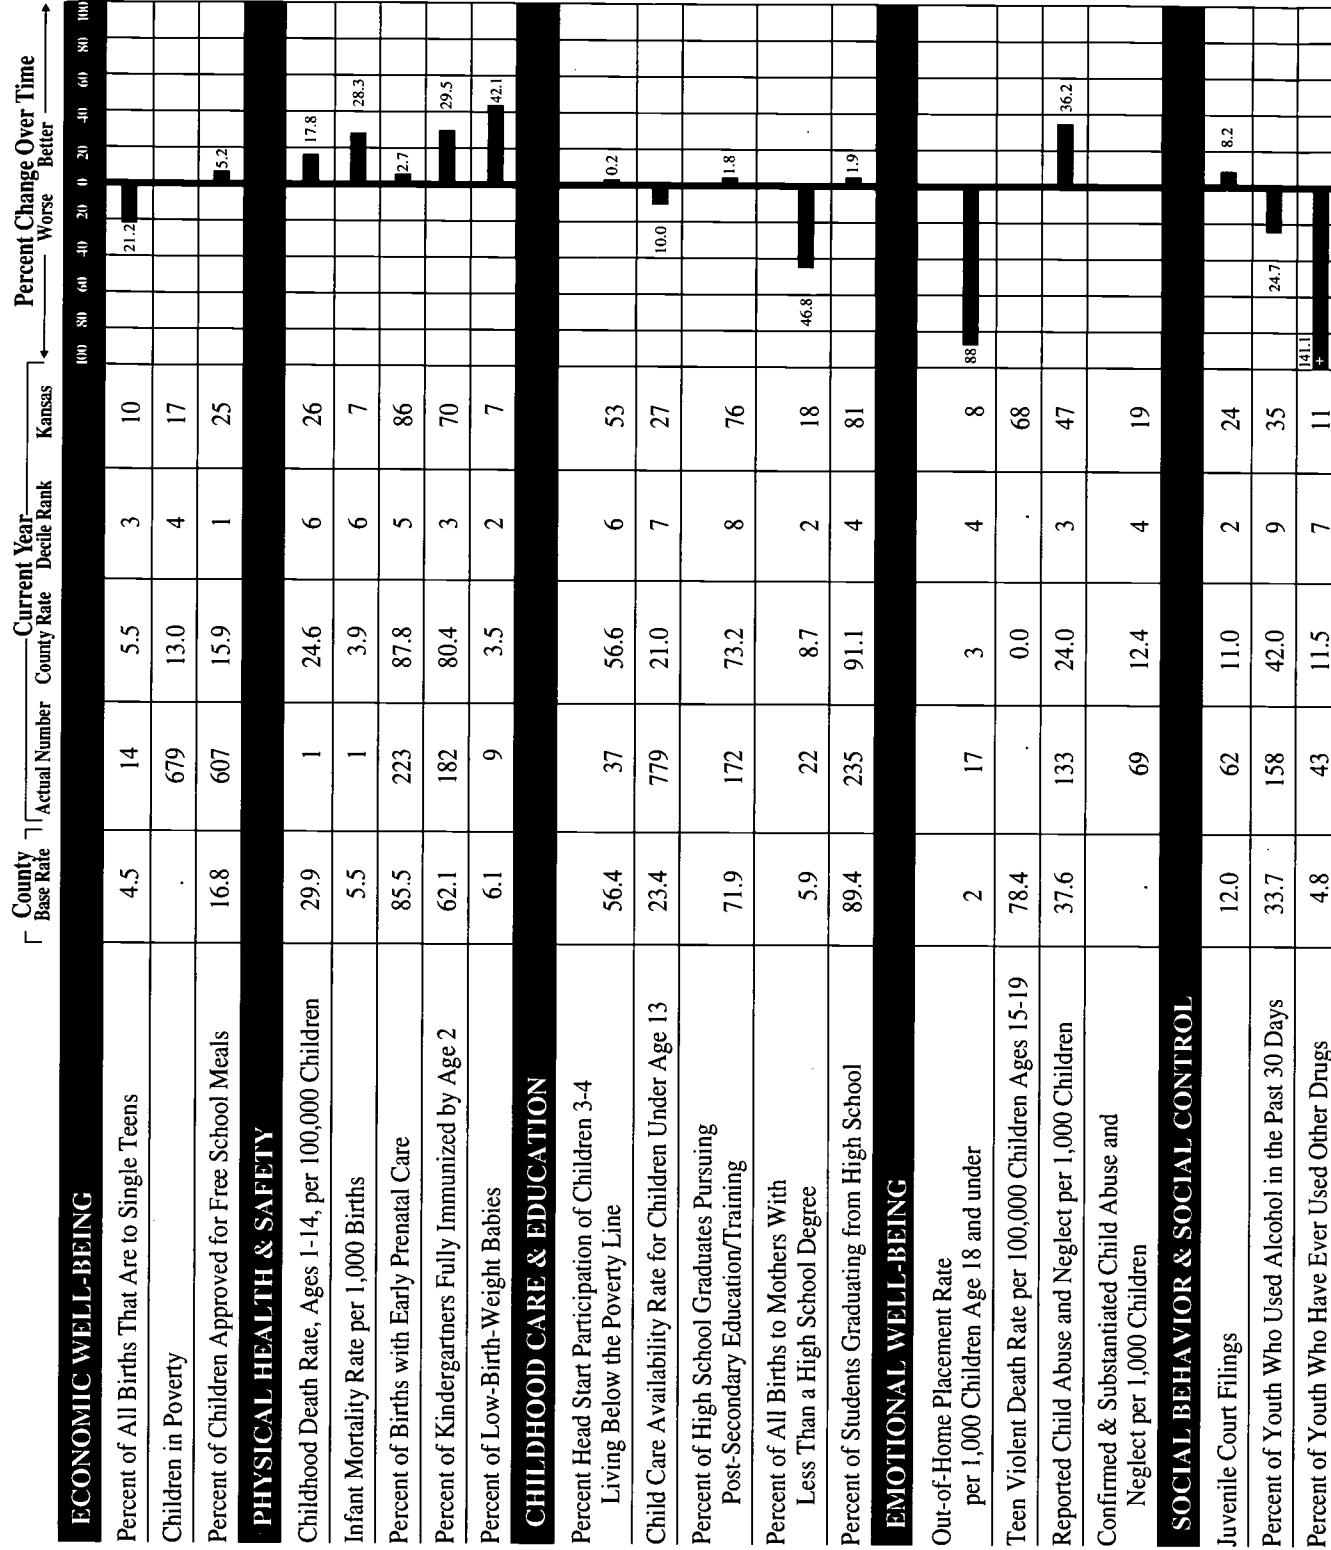

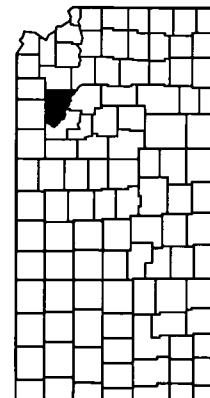

Phillips County showed significant improvement in the percentage of kindergartners fully immunized by age two. Twenty children had the opportunity to participate in the new Head Start program implemented this year. The county saw improvement in the child care availability rate. While the county's percentage of students graduating from high school is far better than the state average, a gradual decline is noted and may be worth investigating.

County Seat: Pratt		

Pratt County was recognized in the best ten percent of the state for its high percentage of graduates pursuing further education or training after high school. The county celebrated its first year of offering a Head Start program for eligible children. Concerns are raised about the decline in births with early prenatal care and the significant increase in the percentage of low-birth-weight babies. For both indicators, the county did worse than the state average. Attention may also be needed in all areas of social behavior and social control.

Median Family Income	\$25,637	\$32,966
Unemployment	2.6%	3.8%
(1997 data provided by Kansas Dept. of Human Resources, Labor Market Information Services)		
County Seat: Belleville		

Republic County showed remarkable improvement in the percentage of kindergartners fully immunized by age two and the percentage of all births to mothers with less than a high school degree. Notable improvement was also seen with both indicators for early childhood care and education. This year, there was a rise in the unemployment rate and a greater percentage of children were approved for free school meals.

County	State	Population Size	10,610	2,477,574
Percent Population Under Age 18		26.3%	26.7%	
Ethnicity				
White		95.6%	88.4%	
Black		1.1%	5.7%

Median Family Income	\$27,406	\$32,966		
Unemployment (1997 data provided by Kansas Dept. of Human Resources, Labor Market Information Services)	3.8%	3.8%		

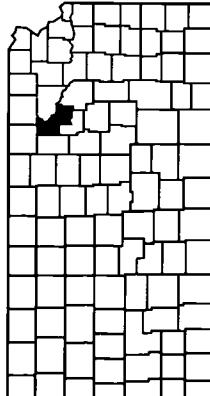

Rice County celebrated significant improvement in the percentage of kindergartners fully immunized by age two. Other notable improvements were recognized: a decline in the percentage of low-birth-weight babies, an increase in the child care availability rate, and an increase in the percentage of eligible children participating in the Head Start program. Rice County may want to explore ways to deter the upward trend for all social behavior and social control indicators. Also of concern was the increase in the percentage of all births to mothers with less than a high school degree.

Percent of Youth Who Have Ever Used Other Drugs	5.6	39	17.9	10	11	27.9

Rooks County performed in the top ten percent of the state for its child availability rate. The county also celebrated a significant increase in the percentage of kindergartners fully immunized by age two, the decline in low-birth-weight babies, and the decline in juvenile court filings. An increase in the percentage of children approved for free school meals may indicate a greater need for a local Head Start program. With the dramatic increase in the percentage of youth who have used alcohol in the past 30 days and the percentage of youth who have ever used other drugs, the county ranked in the worst ten percent of the state for both indicators.

RUSH

	County	State
Population Size	3,842	2,477,574
Percent Population Under Age 18	22.8%	26.7%

Median Family Income	\$25,489	\$32,966
Unemployment	3.5%	3.8% (1997 data provided by Kansas Dept. of Human Resources, Labor Market Information Services)
County Seat: La Crosse		

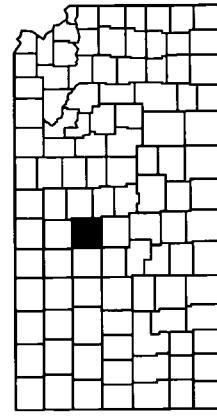

Rush County was among the top performers in the state for the following indicators: percentage of births with early prenatal care, child care availability rate, percentage of all births to mothers with less than a high school degree, and percentage of students graduating from high school. The county also showed significant improvement in the percentage of eligible children participating in the Head Start program. This year there were no teen violent deaths. Of concern were the notable decline in the percentage of high school graduates pursuing post-secondary education or training and the dramatic increase in juvenile court filings.

Russell County celebrated a significant increase in the percentage of high school graduates pursuing secondary education or training. Other good news were the increase in the percentage of kindergartners fully immunized by age two, the decline in the percentage of all births to mothers with less than a high school degree, and the decline in juvenile court filings. The county may want to explore ways to encourage more students to complete high school. Also, with the decline in the child care availability rate, the county may want to assess if there is an adequate number of slots.

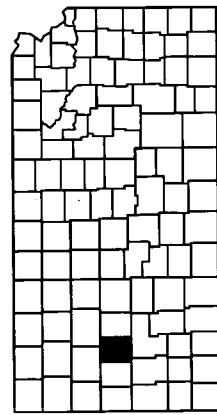

SAINTINE

Population Size	49,301	2,477,574
Percent Population Under Age 18	26.3%	26.7%
Ethnicity		
White	93.0%	88.4%
Black	3.0%	5.7%

Asian or Pacific Islander	1.1%	1.2%
Hispanic Origin (All Races)	2.5%	3.8%
Median Family Income	\$31,030	\$32,966
Unemployment (1997 data provided by Kansas Dept. of Human Resources, Labor Market Information Services)	3.6%	3.8%
County Seat: Salina		

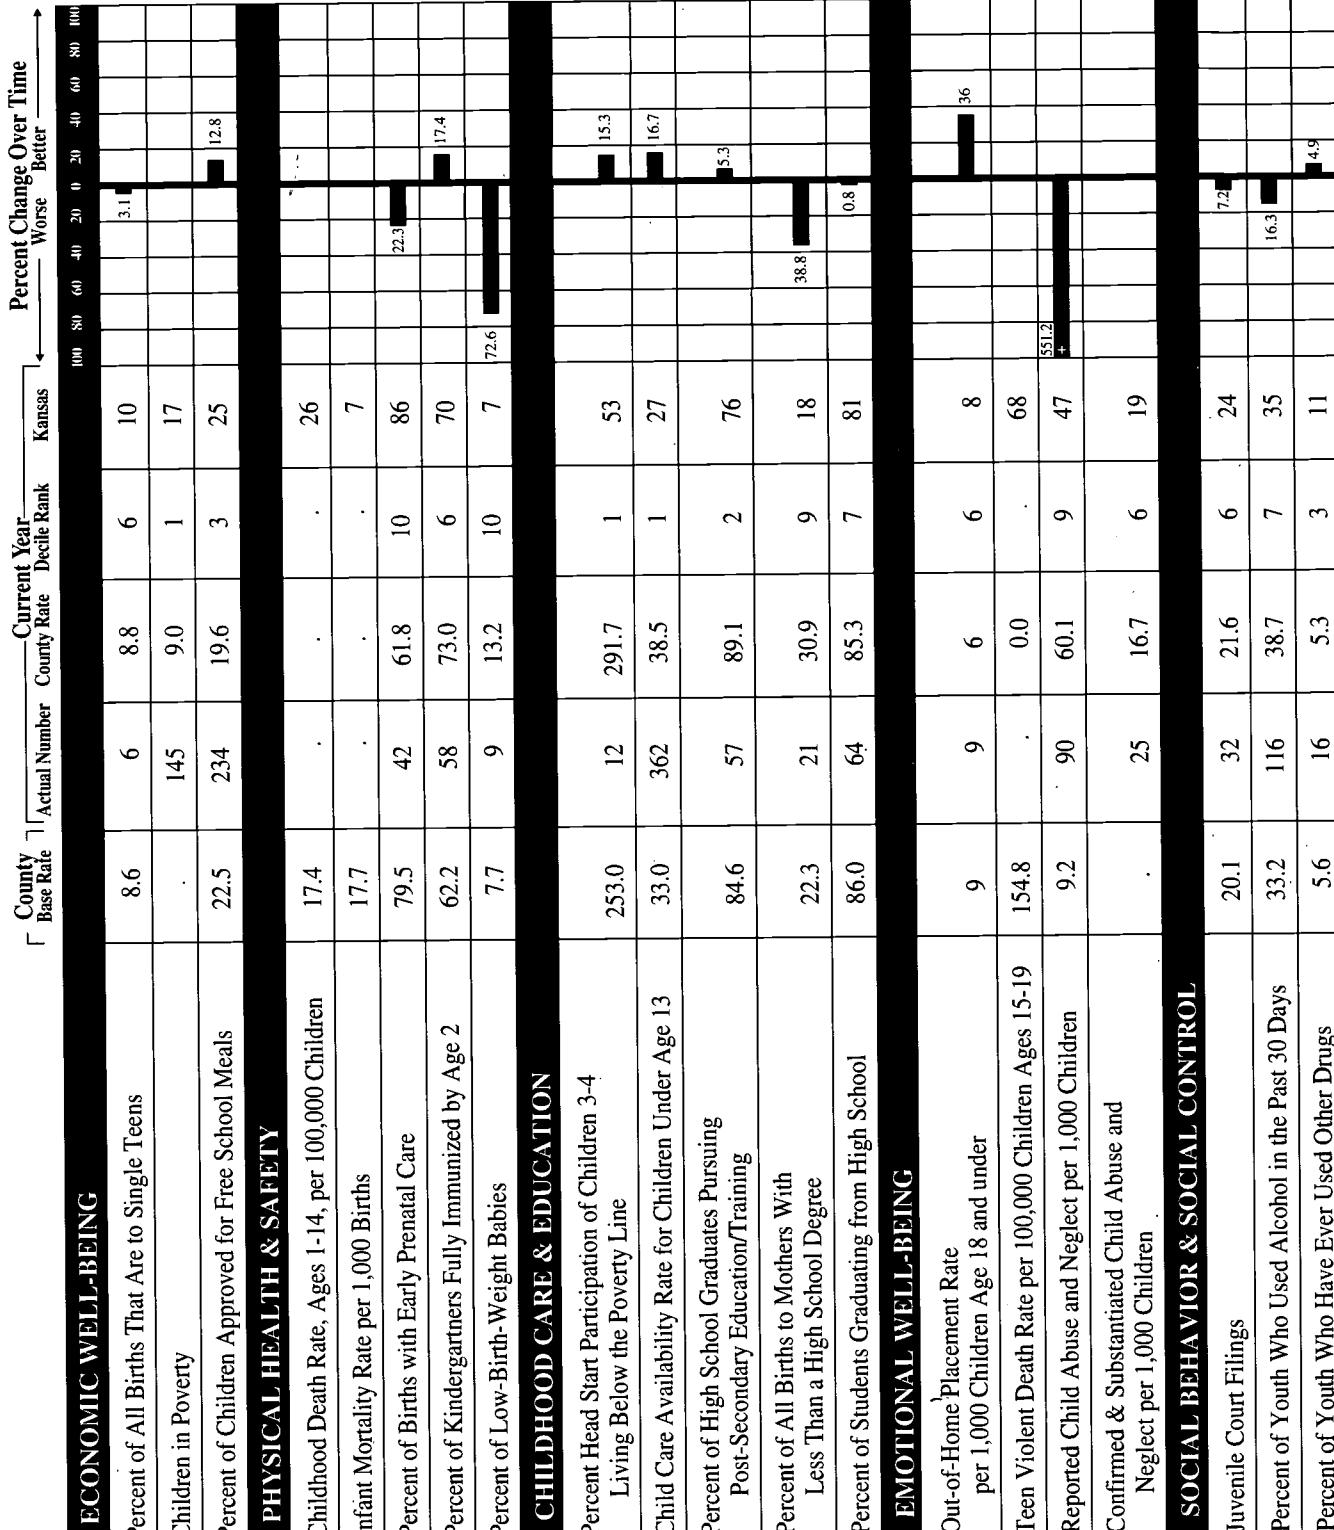

Saline County was recognized as one of the best performers in the state for its child care availability rate. The county also celebrated an increase in the percentage of kindergartners fully immunized by age two, an increase in the percentage of high school graduates pursuing post-secondary education, and a decline in juvenile court filings. Dramatic increases in the percentage of low-birth-weight babies and in the percentage of all births to women with less than a high school degree raised concerns. Also noted, a greater percentage of youth reported they had used drugs other than alcohol.

	County	State
Population Size	5,289	2,477,544
Percent Population Under Age 18	28.9%	26.7%
Ethnicity		
White	96.8%	88.4%
Black	0.1%	5.7%

Median Family Income	\$29,267	\$32,966
Unemployment (1997 data provided by Kansas Dept. of Human Resources, Labor Market Information Services)	2.1%	3.8%
County Seat: Scott City		

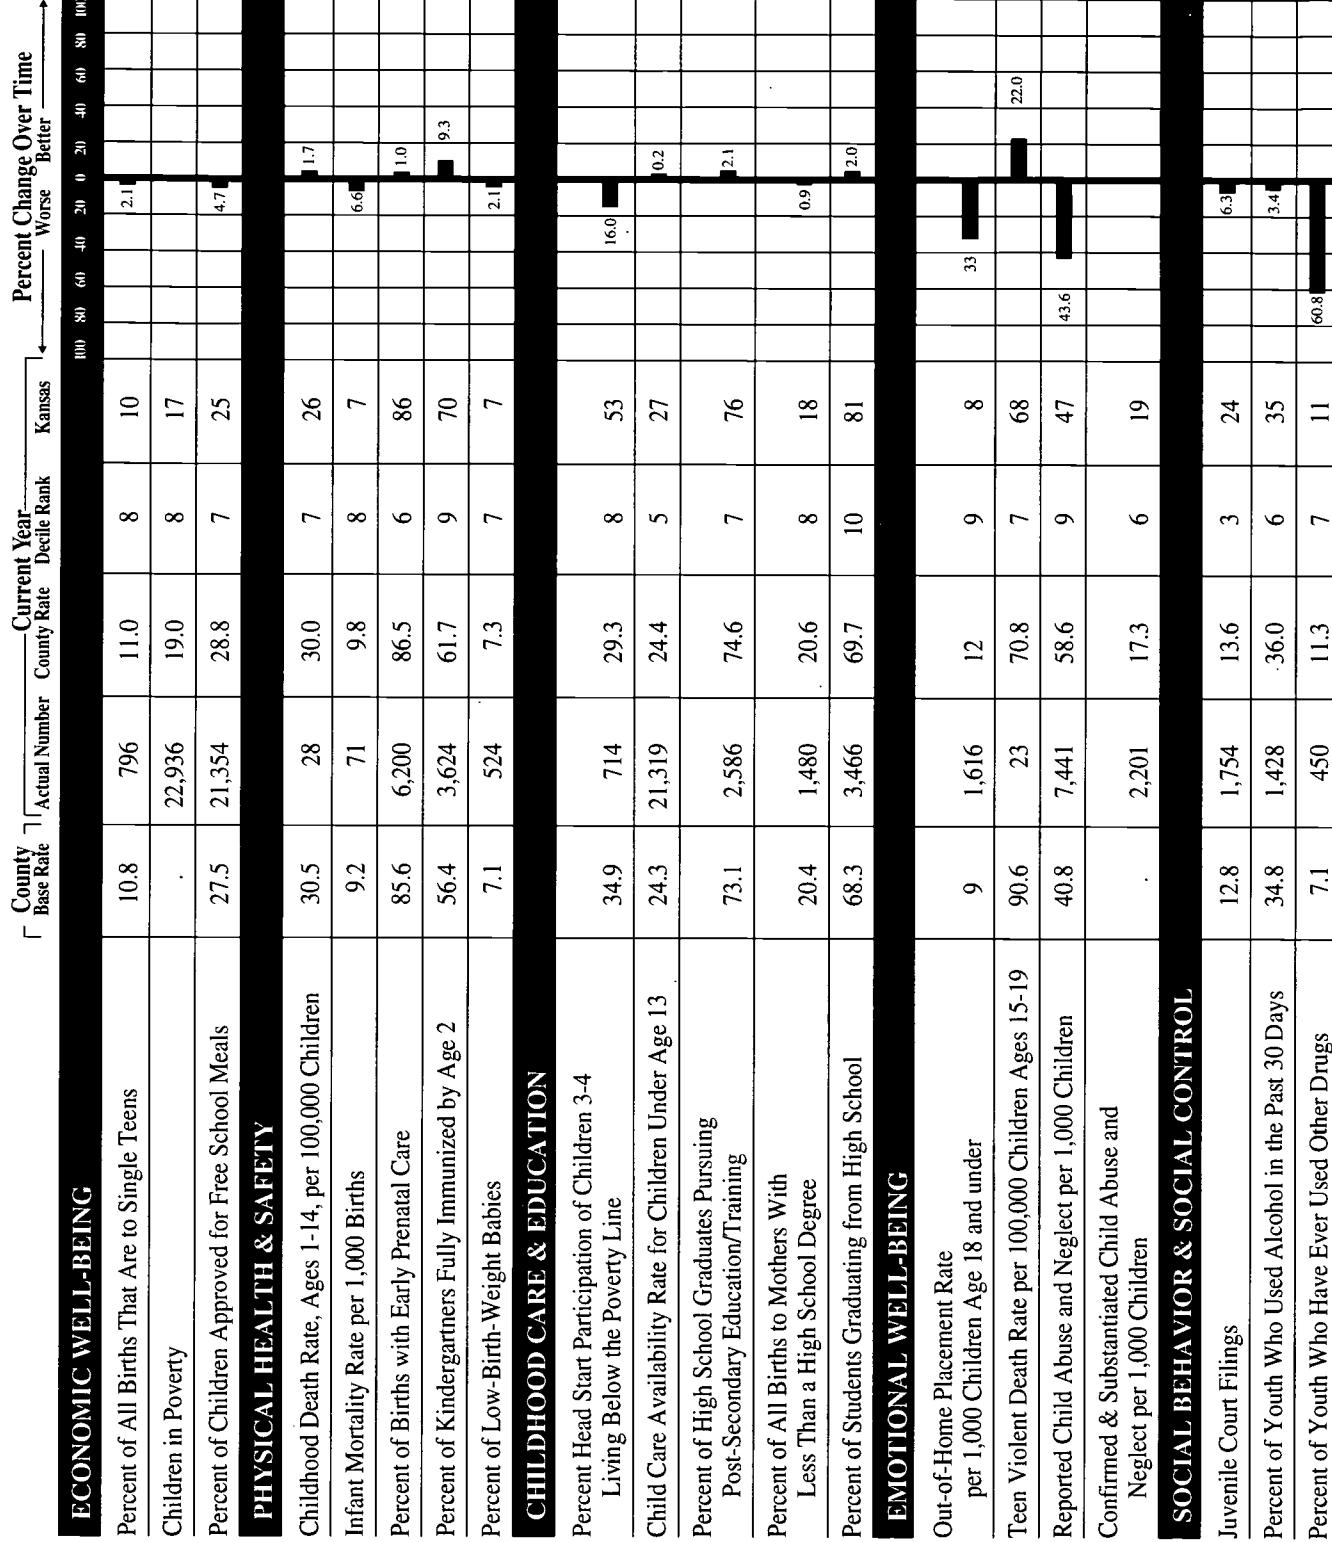

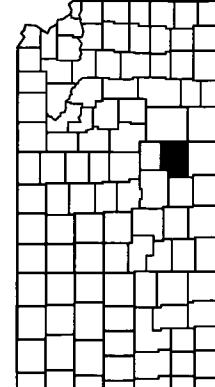

Scott County saw a decline in the unemployment rate, which was good news. For both indicators in the area of early childhood care and education, the county ranked in the best ten percent of the state. Scott County showed improvement in the percentage of kindergartners fully immunized by age two. This year, 30 percent of all births were to mothers with less than a high school degree, which is a cause for concern. Also, the county ranked in the worst ten percent of the state for its percentage of births with early prenatal care and percentage of low-birth-weight babies.

Median Family Income	\$32,966
Unemployment (1997 data provided by Kansas Dept. of Human Resources, Labor Market Information Services)	3.4% 3.8%
County Seat: Wichita	

Sedgewick County saw a decline in the unemployment rate. Also worth celebrating, the county experienced an increase in the percentage of kindergartners immunized by age two and a decline in the teen violent death rate. Increases in the percentage of students graduating from high school and percentage of graduates pursuing post-secondary education or training were encouraging. A significant increase in the out-of-home placement rate was noted. The county may want to investigate the causes for the dramatic decline in the percentage of eligible children participating in the Head Start program.

Sheridan County ranked in the best ten percent of the state for all indicators in the area of educational achievement. The county was also recognized as one of the best performers in the state for the following: percentage of births to single teens, percentage of kindergartners fully immunized by age two, percentage of low-birth-weight babies, reported cases of child abuse and neglect, and juvenile court filings rate. An increase in the percentage of children approved for free school meals may indicate a worsening of economic conditions.

County Seat: Goodland		

Sherman County celebrated its rank in the best ten percent of the state for the percentage of kindergartners fully immunized by age two. Improvements were seen with all indicators in the areas of Educational Achievement and Early Childhood Care & Education. The decline in the percentage of all births to single teens and the rise in percentage of births with early prenatal care were also good news. Of concern, there were percentage increases for all indicators related to Social Behavior & Control.

SOCIAL BEHAVIOR & SOCIAL CONTROL	
Juvenile Court Filings	13.2
Percent of Youth Who Used Alcohol in the Past 30 Days	24.5
Percent of Youth Who Have Ever Used Other Drugs	3.0

Smith County ranked in the best ten percent of the state for the percentage of all births to single teens, the percentage of high school graduates pursuing post-secondary education or training, and the rate of child care availability. The county also celebrated a significant increase in the percentage of all births to mothers with less than a high school degree. With dramatic increases in the juvenile court filings rate and the percentage of youth who used alcohol in the past 30 days, attention may be warranted in the area of social behavior and social control.

STAFFORD

(1997 data provided by Kansas Dept. of Human Resources, Labor Market Information Services)	
County Seat: St. John	3.8%

Stafford County showed significant improvement with all indicators related to educational achievement. The increase in the percentage of kindergartners fully immunized by age two and the decrease in the percentage of low-birth-weight babies were good news. Thirty eligible children participated in the newly implemented Head Start program. The county may want to assess if there is adequate child care available. There was a notable increase in juvenile court filings.

County Seat:	Johnson City	

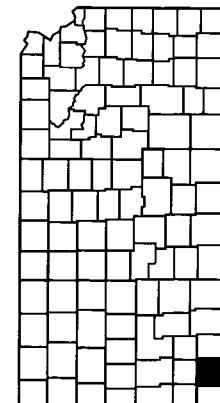

Stanton County experienced a decline in juvenile court filings, which indicated improvement. This year, there were no low-birth-weight babies, which was also good news. The county may want to explore ways to increase the percentage of kindergartners fully immunized by age two. Also of concern were the negative trends for all indicators related to Educational Achievement and Early Childhood Care & Education.

County Seat:	Hugoton

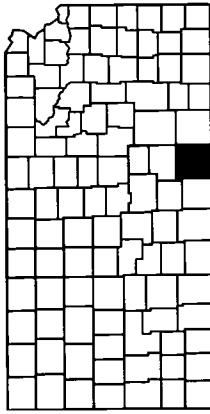

Stevens County celebrated a significant decline in the unemployment rate. The county saw improvement in the percentage of high school students pursuing post-secondary education or training and in the percentage of births with early prenatal care. A substantial increase in the out-of-home placement rate was noted. While Stevens County experienced an increase in the percentage of kindergartners fully immunized by age two, the county ranked in the worst ten percent of the state for this indicator. Also of concern, 32 percent of all births were to mothers with less than a high school degree.

Summer County ranked in the best 20 percent of the state for its rate of Head Start participation of eligible children. Increases in the percentage of kindergartners fully immunized by age two and the percentage of births with early prenatal care, as well as declines in the percentage of low-birth-weight babies and the percentage of all births to single teens, were also good news. This year, there were no teen violent deaths. While there was a decline in juvenile court filings, there was a significant increase in the percentage of youth who reported using drugs other than alcohol. The county may want to assess if more child care slots are needed.

Wallace County performed in the best ten percent of the state for the following: percentage of kindergartners fully immunized by age two, percentage of high school graduates pursuing post-secondary education or training, and juvenile court filings rate. The county can also boast improvements with both indicators related to early childhood care and education, as well as an improvement in the percentage of births with early prenatal care. An increase in the percentage of children approved for free school meals may indicate economic conditions are worsening.

County Seat: Leoti

WICHITA COUNTY experienced improvement in the percentage of high school graduates pursuing post-secondary education or training. Increases in the percentage of eligible children participating in the Head Start program and the rate of child care availability were also good news.

The dramatic decline in the percentage of students graduating from high school raised concerns. Wichita County ranked in the worst ten percent of the state for its high percentage of all births to mothers with less than a high school degree and its high rate of out-of-home placements.

Median Family Income
Unemployment (1997 data provided by Kansas Dept. of Human Resources, Labor Market Information Services)

County Seat: Fredonia

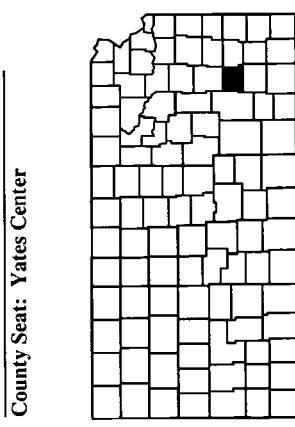

Wilson County saw a decline in the unemployment rate, which was good news. Percentage increases in the following indicators were also good news: kindergartners fully immunized by age two, eligible children participating in the Head Start program, child care availability rate, and high school graduates pursuing post-secondary education or training. The county may want to explore ways to encourage more students to complete high school. Wilson County ranked in the worst ten percent of the state for its high percentage of births to single teens.

WOODSON

DEMOCRAPHICS

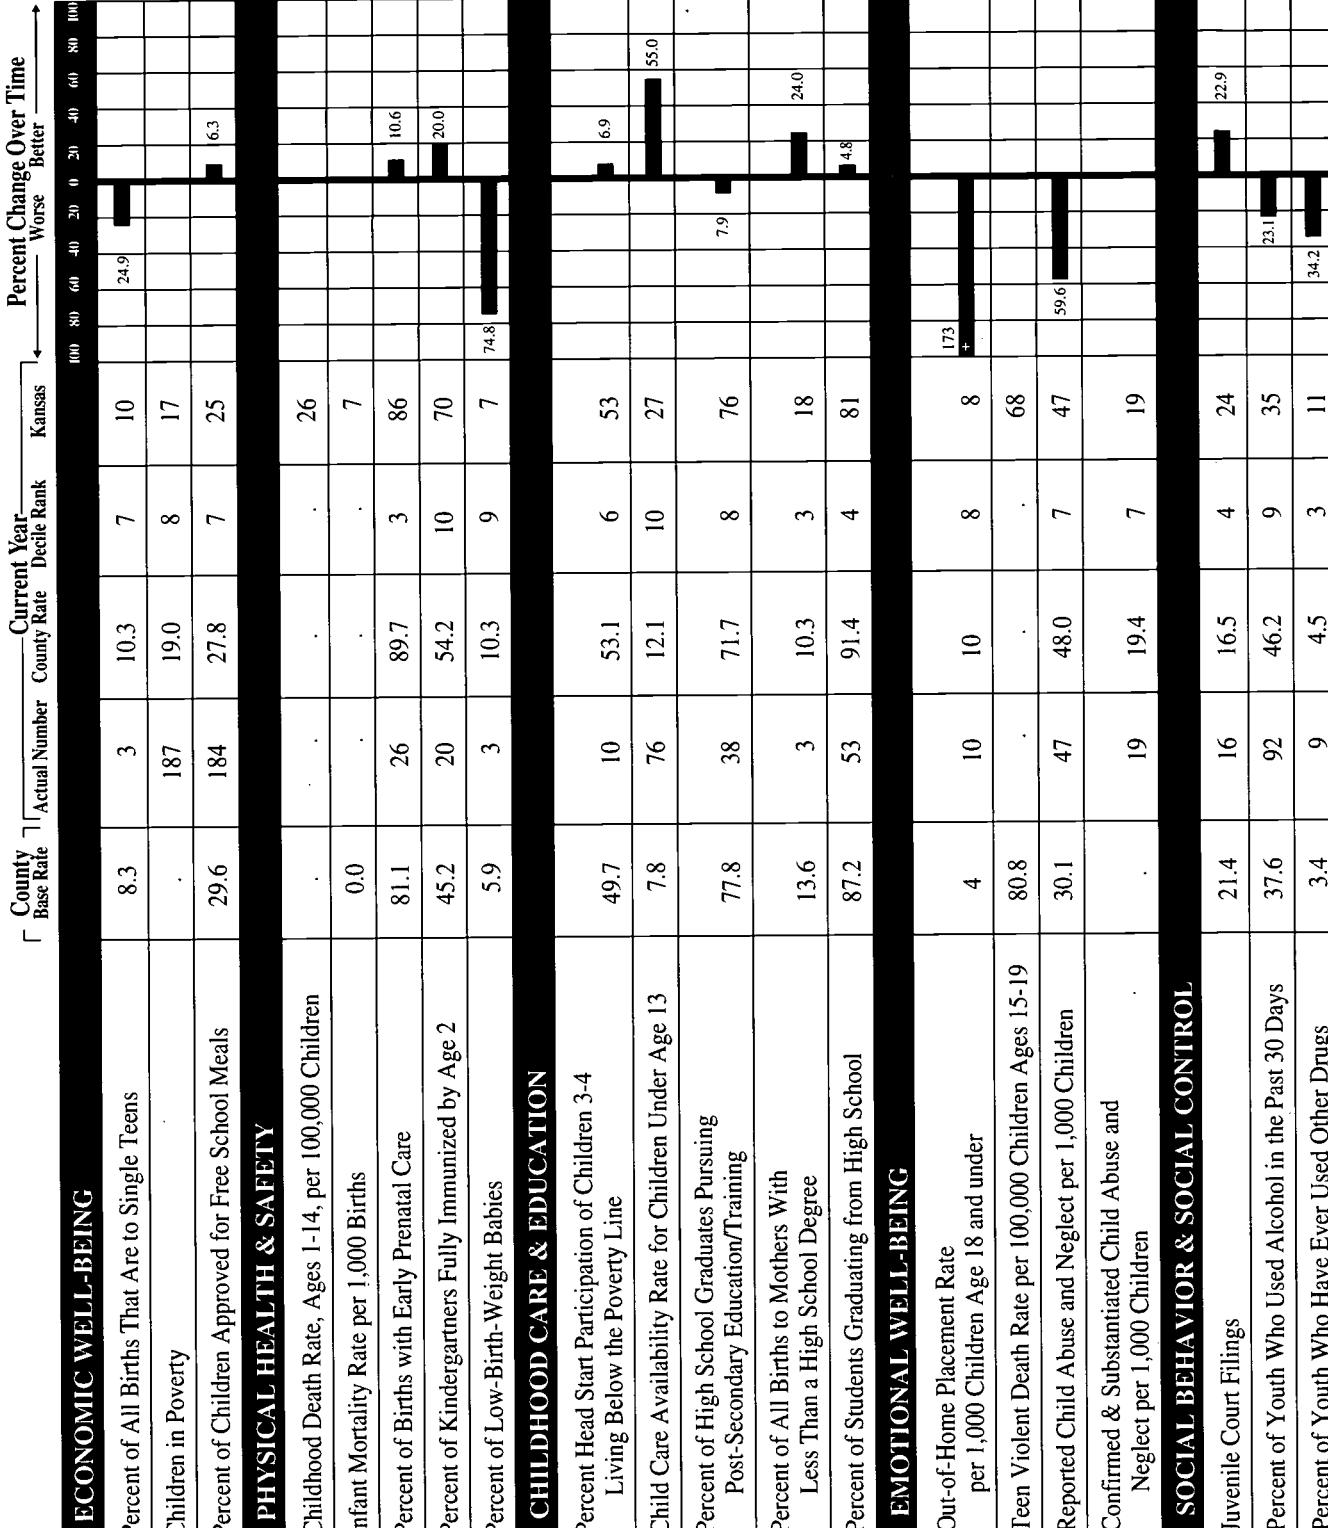

Based on 1990 U.S. Census

	County	Actual Number	Current Year Base Rate	County Rate	Decile Rank	Kansas	Percent Change Over Time Worse Better	Population Size Under Age 18	24.0% 26.7%	4,116 2,477,574	State

Data provided by Kansas Dept. of Human Resources, Labor Market Information Services											

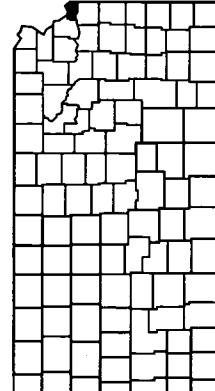

Woodson County experienced improvements in the percentage of students graduating from high school, in the percentage of births with early prenatal care, and in the percentage of all births to mothers with less than a high school degree.

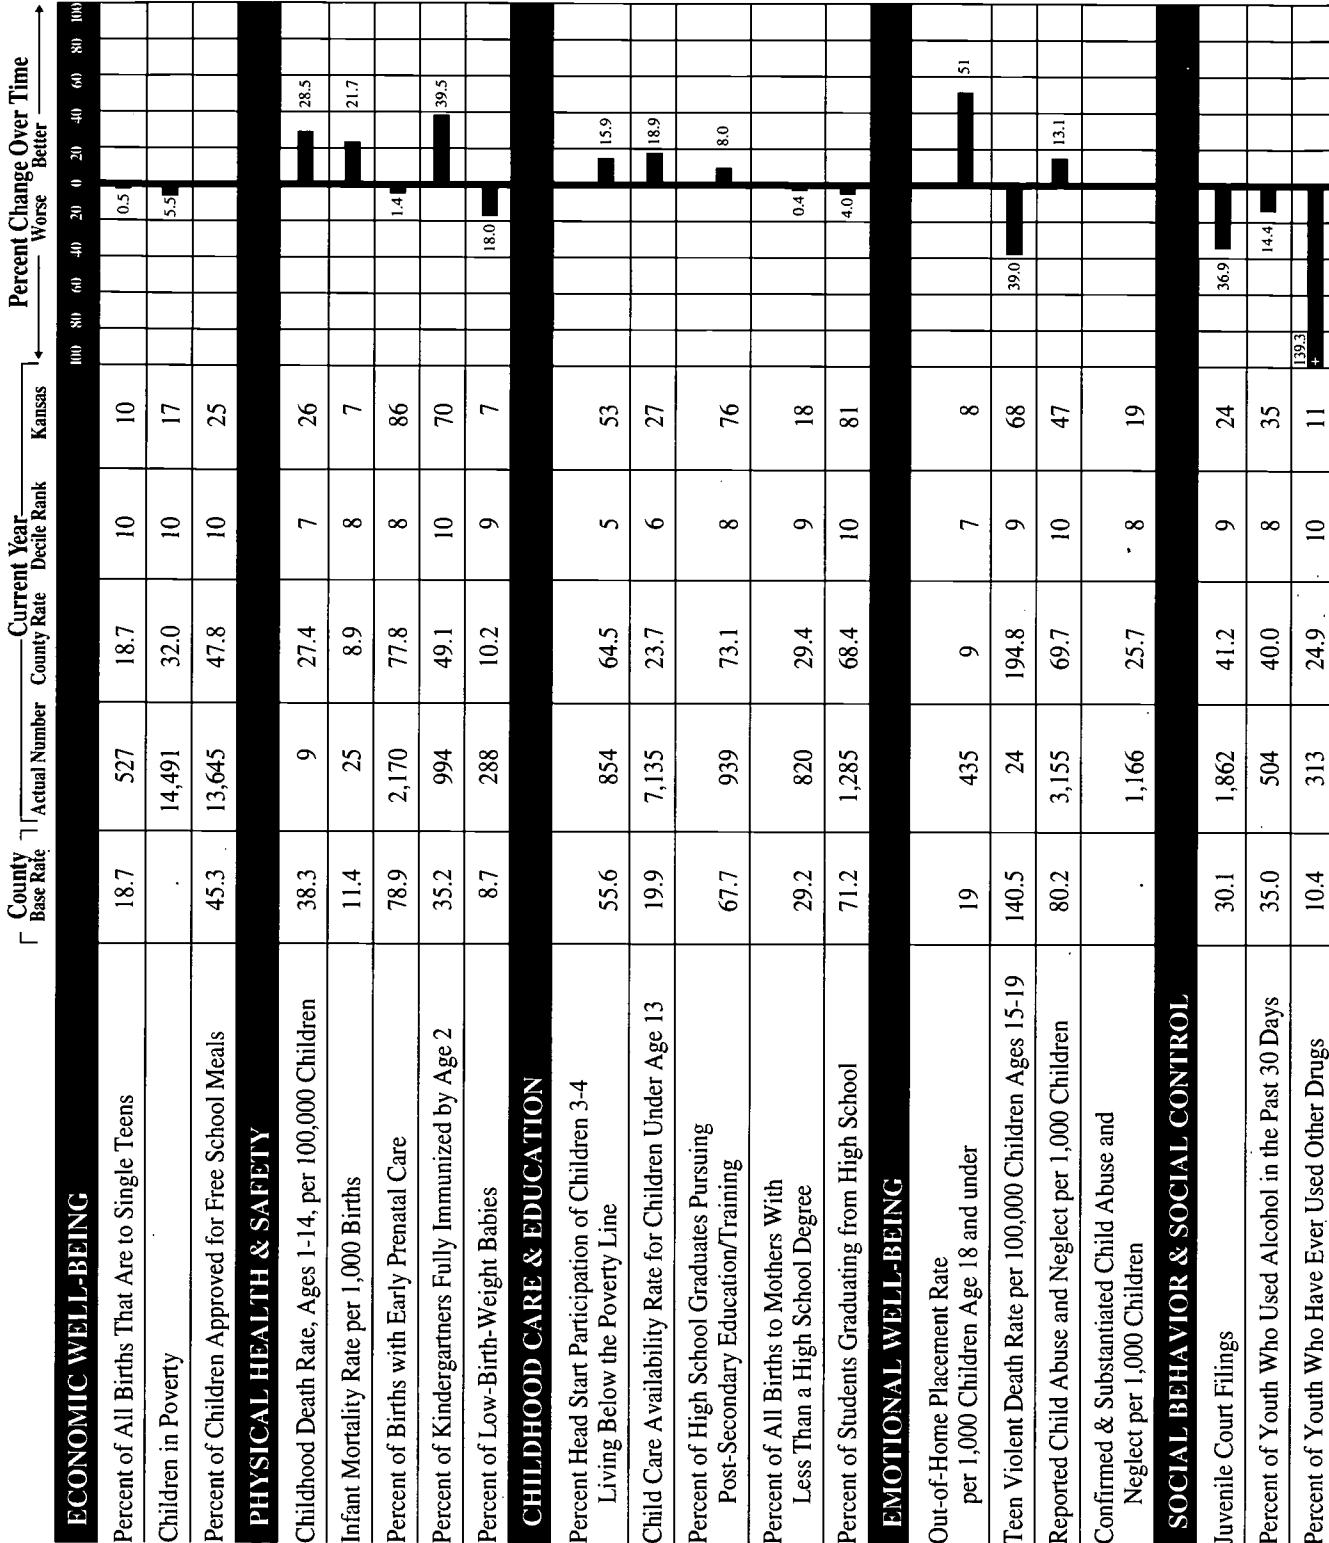

The decline in juvenile court filings and increase in Head Start participation were also good news. While there were significant improvements in the percentage of kindergartners fully immunized by age two and in the child care availability rate, the county did worse than the state average in both indicators. Woodson County may want to explore ways to encourage further improvement.

Population Size	161,993	2,477,574

Unemployment (1997 data provided by Kansas Dept. of Human Resources, Labor Market Information Services)	6.9%	3.8%
County Seat: Kansas City		

Wyandotte County showed improvement in both areas related to early childhood care and education. Declines in the childhood death rate and in the infant mortality rate were also good news. A dramatic decline in the out-of-home placement rate was noted. While the county ranked in the worst ten percent of the state for its low percentage of kindergartners fully immunized by age two, significant improvement could be seen. Wyandotte County ranked in the worst ten percent of the state for all indicators related to economic well-being, which raised concerns.

DATA NOTES AND SOURCES

ECONOMIC WELL BEING

Births to Single Teens is the percentage of live births that occur to unmarried women under the age of 20. The Kansas Department of Health and Environment provides data by calendar year.

Children in Poverty is an estimate of the percentage of children under age 18 who live in families with incomes below the U.S. poverty threshold as defined by the U.S. Office of Management and Budget. The estimates are based on a sample of families surveyed each March in the Current Population Survey. Currently available data report family income for 1993. In calendar year 1993, the poverty threshold for a typical family of four persons was \$14,763.

Children Approved for Free School Meals is the percentage of children enrolled in school in an academic year who have been approved for free school meals. Data are from the Kansas State Board of Education.

Children Receiving Economic Assistance is the number of children receiving any form of cash assistance (adoption subsidy, TANF, foster care, general assistance or refugee assistance), medical assistance (child in state institution, extended medical, pregnant women and children, medically needy, disabled medically needy families, SSI disabled, special pregnant women and children or work transition) or food stamps per 100 children under the age of 18. Each child receiving one or more forms of assistance is counted only once. The count is obtained from a single month (June 1998) and is therefore not indicative of the total number of children receiving assistance during the entire year. Data are from the Kansas Department of Social and Rehabilitation Services.

PHYSICAL HEALTH AND SAFETY

Childhood Death, Ages 1-14 (per 100,000 children) is the number of deaths from all causes per 100,000 children ages one through 14. Data regarding childhood deaths by calendar year are from the Kansas Department of Health and Environment. Population data are obtained from estimates made by the U.S. Census Bureau.

Infant Mortality (per 1,000 live births) is the number of deaths of infants under one year of age per 1,000 live births in the last calendar year. The data were provided by the Kansas Department of Health and Environment.

Births with Early Prenatal Care is the percentage of births in the last calendar year that are to women who started prenatal care in the first three months of their pregnancy as indicated on the birth certificate. Data are from the Kansas Department of Health and Environment.

Kindergartners Fully Immunized by Age 2 is the percentage of children in kindergarten who had received all recommended immunizations by age two. It is based on a retrospective survey of immunization certificates done each fall at the time of enrollment in kindergarten. Data are from the Kansas Department of Health and Environment.

Low-Birth-Weight Babies is the percentage of live births in a calendar year that are recorded as low-birth-weight. Babies of low-birth-weight are those who weigh under 2,500 (5.5 pounds) at birth. The data are from the Kansas Department of Health and Environment.

CHILDHOOD CARE & EDUCATION

Head Start Participation is the number of Head Start enrollment slots divided by the estimated number of children ages three to four living in families with incomes below the U.S. poverty threshold. Rates are expressed as percentages. Data on Head Start enrollment are from the U.S. Department of Health and Human Services, Region VII. Data on children in poverty are based on poverty estimates (Children in Poverty indicator above) and population estimates from the U.S. Census Bureau.¹

Child Care Availability is the capacity of registered day care homes, licensed day care homes, group day care homes, child care centers, and preschools per one hundred children under age 13 in the population. The child care data are from the Kansas Department of Health and Environment. Population estimates for children under age 13 are from the U.S. Census Bureau.¹

High School Graduate Post Secondary Education/Training is the percentage of the last year's high school graduating class that are enrolled in post-secondary education or training (four-year college or university, two-year college, other type of college or other non-college institution) five to six months after graduation. Data are from school districts' annual survey of graduates compiled by the Kansas Department of Education.

Births to Mothers with Less than a High School Degree is the percent of live births in the past calendar year that occur to women who have not received a high school degree as indicated on the birth certificate. Data are from the Kansas Department of Health and Environment.

Students Graduating High School is the percentage of ninth-grade public school students who graduated four years later. Rates are calculated by dividing the number of graduates by the sum of graduates and dropouts from grades nine through 12. Data are from the Kansas State Board of Education.

DATA NOTES AND SOURCES

EMOTIONAL WELL BEING

Teen Violent Deaths, Ages 15-19 (per 100,000 teens) is the number of deaths in a calendar year from homicides, suicides, and accidents to teens ages 15 through 19 per 100,000 teens of those ages. The data for teen deaths are from the Kansas Department of Health and Environment. Teen population estimates are from the U.S. Census Bureau.¹

Reported Child Abuse/Neglect Rate is the number of official child abuse/neglect reports per 100,000 children in the population under age 18. Data on child abuse/neglect reports are from the Kansas Department of Social and Rehabilitation Services. Data on the population of children under 18 are from estimates provided by the U.S. Census Bureau.¹

Confirmed or Substantiated Child Abuse/Neglect Rate is the number of cases substantiated upon investigation of child abuse/neglect (child protective services worker determines that abuse or neglect occurred) per 100,000 children and youth under age 18. Data on child abuse/neglect reports are from the Kansas Department of Social and Rehabilitation Services. Data on the population of children under 18 are from estimates provided by the U.S. Census Bureau.¹

Out-of-Home Placement Rate is the number of children and youth who are in SRS custody and in placement outside their family of origin per 1,000 children and youth age 18 and under. Data on children in placement are from the Kansas Department of Social and Rehabilitation Services. Data on the population of children under 18 are from estimates provided by the U.S. Census Bureau.¹

SOCIAL BEHAVIOR & SOCIAL CONTROL

Juvenile Court Filings is the number of court filings for juvenile offenders between July and June of a given fiscal year per 1,000 children and youth under the age of 18. Data on the number of filings are from the *Annual Report on the Courts of Kansas*, Office of Judicial Administration. Data on the population of children under 18 are from estimates provided by the U.S. Census Bureau.¹

Youth Who Report Using Alcohol in the Past 30 Days is the percentage of youth in grades six, eight, ten, and 12 who indicated any use of alcohol in the 30 days prior to completing a survey on alcohol and other drug use. The percentage of children completing the survey in each county varies from year to year and may make the data unreliable. Data are provided by the Southeast Kansas Education Service Center.

Youth Who Report Binge Drinking is the percentage of youth in grades six, eight, ten, and 12 who indicated taking five or more consecutive drinks on one occasion prior to completing a survey on alcohol and other drug use. The percentage of children completing the survey in each county varies from year to year and may make the data unreliable. Data are provided by the Southeast Kansas Education Service Center.

Youth Who Have Ever Used Other Drugs is the percentage of youth in grades six, eight, ten, and 12 responding to an annual survey who indicated any use of the following drugs: marijuana, cocaine, inhalants, or LSD. The percentage of children completing the survey in each county varies from year to year and may make the data unreliable. Data are provided by the Southeast Kansas Education Service Center.

DEMOGRAPHICS

Unemployment is the percent of the civilian labor force estimated to be unemployed. Annual estimates are provided by the Kansas Department of Human Resources, Labor Market Information Services.

All other measures of demographic characteristics are taken from the 1990 Census of the Population. Median family income is the annual family income that half the families in Kansas exceed and half fall below. Families are two or more persons who are related by birth, marriage, or adoption and who live together as one household.

¹ The Population Estimates Program produces for counties each year: total population estimates and county estimates by age, sex, race, and Hispanic origin. The release of total population estimates in the winter also includes demographic components of change. In the summer, the program releases the estimates by age, sex, race, and Hispanic origin. The reference date for county population estimates is July 1. For more information, contact the Population Division's Statistical Information Staff at (301) 457-2422.

II. REPRODUCTION RELEASE:

In order to disseminate as widely as possible timely and significant materials of interest to the educational community, documents announced in the monthly abstract journal of the ERIC system, *Resources in Education* (RIE), are usually made available to users in microfiche, reproduced paper copy, and electronic media, and sold through the ERIC Document Reproduction Service (EDRS). Credit is given to the source of each document, and, if reproduction release is granted, one of the following notices is affixed to the document.

If permission is granted to reproduce and disseminate the identified document, please CHECK ONE of the following three options and sign at the bottom of the page.

The sample sticker shown below will be affixed to all Level 1 documents	The sample sticker shown below will be affixed to all Level 2A documents	The sample sticker shown below will be affixed to all Level 2B documents
PERMISSION TO REPRODUCE AND DISSEMINATE THIS MATERIAL HAS BEEN GRANTED BY _____ <i>Sample</i> _____ TO THE EDUCATIONAL RESOURCES INFORMATION CENTER (ERIC) 1	PERMISSION TO REPRODUCE AND DISSEMINATE THIS MATERIAL IN MICROFICHE, AND IN ELECTRONIC MEDIA FOR ERIC COLLECTION SUBSCRIBERS ONLY, HAS BEEN GRANTED BY _____ <i>Sample</i> _____ TO THE EDUCATIONAL RESOURCES INFORMATION CENTER (ERIC) 2A	PERMISSION TO REPRODUCE AND DISSEMINATE THIS MATERIAL IN MICROFICHE ONLY HAS BEEN GRANTED BY _____ <i>Sample</i> _____ TO THE EDUCATIONAL RESOURCES INFORMATION CENTER (ERIC) 2B

Level 1

Check here for Level 1 release, permitting reproduction and dissemination in microfiche or other ERIC archival media (e.g., electronic) and paper copy.

Level 2A

Check here for Level 2A release, permitting reproduction and dissemination in microfiche and in electronic media for ERIC archival collection subscribers only

Level 2B

Check here for Level 2B release, permitting reproduction and dissemination in microfiche only

Documents will be processed as indicated provided reproduction quality permits.
If permission to reproduce is granted, but no box is checked, documents will be processed at Level 1.

I hereby grant to the Educational Resources Information Center (ERIC) nonexclusive permission to reproduce and disseminate this document as indicated above. Reproduction from the ERIC microfiche or electronic media by persons other than ERIC employees and its system contractors requires permission from the copyright holder. Exception is made for non-profit reproduction by libraries and other service agencies to satisfy information needs of educators in response to discrete inquiries.
